SAGE ENDOWMENT FUND
THE GIFT OF
HENRY W. SAGE

1891

The date shows when this volume was taken.

To renew this book copy the call No. and give to
the librarian.

HOME USE RULES

All Books subject to recall

All borrowers must register in the library to borrow books for home use.

All books must be returned at end of college year for inspection and repairs.

Limited books must be returned within the four week limit and not renewed.

Students must return all books before leaving town. Officers should arrange for the return of books wanted during their absence from town.

Volumes of periodicals and of pamphlets are held in the library as much as possible. For special purposes they are given out for a limited time

Borrowers should not use their library privileges for the benefit of other persons

Books of special value and gift books, when the giver wishes it, are not allowed to circulate.

Readers are asked to report all cases of books marked or mutilated

Do not deface books by marks and writing.

PREFACE

Three facts have conspired to overcome a natural hesitation to commit the enormity of another book in these disturbed times: First, the exigencies of social reconstruction demand that some threads of policy be offered to those who grope through the labyrinth. Second, the unparalleled official recognition of social work by the government—by President Wilson, Secretary Baker, Secretary Daniels, Secretary Lane, the governors of various States, and others—puts social workers, new and old, upon their mettle. The very proposals of statesmanlike social workers which were formerly stigmatized as visionary, revolutionary, or immoral are now embraced wholesale as the social creed which alone can save a country in its hour of crisis. Hence, social workers must practice the humility and modesty of science; they must also make good and justify by their works the new faith placed in them. This means a constant effort to refresh their own mental outfit and to improve their equipment by every possible means. Third, the enormous war-time extension of various forms of social-welfare activity has called into service hundreds and even thousands of men and women, some of them only partly trained, many of them utterly untrained. Whether they elect to seek professional training or whether they enlist only as volunteers and amateurs, if they are to become permanent assets instead of liabilities to scientific social work they must somehow or other get the scientific and professional attitude toward their work.

Now a profession is distinguished from a trade by several marks. A trade is based on practical rules and

is followed for a livelihood. A profession is based on principles, a thoroughgoing knowledge of contributory sciences, and a definite code of conduct. One lives *by* a trade but *in* a profession. Membership in a profession includes the obligation to extend the boundaries of one's science while maintaining the scientific attitude toward each day's problems. Alfred Russell Wallace once published a book which he called "Studies Scientific and Social." Was this a covert slap at *social* science as distinguished from *scientific* science? Rather, I think, an attempt to show that the same rigorous scientific mind could compass the problems of both exact science and human society. Social science and its applications must share the spirit, if not the strict technique, of the exact sciences. The elements of scientific approach and scientific prevision must be back of all social reform which hopes to weather the storms.

Since most of real social reform must be carried out through detailed administrative methods by social workers, the main part of this book has to do with their problems. But it seemed advisable to restate the philosophical and psychological principles upon which I believe sound social work is based and by which it is justified. Moreover, social workers as well as other people are prone to become so absorbed in the routine of their daily work, so entangled in the details of individual cases, that they are likely to lose all sense of perspective and to become unable to see the woods for the trees. Hence two or three chapters on the trend of social movements are offered as a means of orientation. Since the frontier of the social case worker joins that of the reformer and propagandist, surely no one will object to including some cautions to social reformers, particularly when they may be taken with equally good grace by the social worker. If the inclusion of such concrete problems as why workers and agencies go stale or how to reduce labor turnover in social agencies seems to de-

stroy the placid flow of our philosophical brook, or if the introduction of crabbed graphs and statistical tables jars upon delicately tuned æsthetic nerves, the justification must plainly be that science is not only an attitude but a method. The scientific spirit will justify itself in social work only if it can reveal the hidden potencies of individuals and agencies, evoke their energies most effectively, and point the way not only to solving methodically each day's problems but to taking an appropriate place in the whole foreward movement of humanity. However the argument may seem to stray, it comes back constantly to one central theme, namely, what is the social worker's part in the movements for enlarging the charter of human liberties, and on what terms can he serve that cause most effectively? Since, as we shall discover, the scientific spirit signifies loyalty and coöperation, it behooves me here to tender my heartiest appreciation to all those friendly social workers whose challenge has evoked these pages, and particularly to that large group whose patient self-analysis made possible Chapters VI and VII.

ARTHUR JAMES TODD.

WORK**

THE SCIENTIFIC SPIRIT AND SOCIAL WORK

CHAPTER I

NATURAL RIGHTS AND SOCIAL WRONGS

Modern social-reform movements and organized social work can be interpreted from two standpoints: First, as the concrete expression of a new social philosophy; second, as the natural consequences of a series of historical facts. The first is a problem in social ethics, political philosophy, and the changing *mores*. The second is a chapter in economics and political history of which we need scarcely do more than review some of the paragraph headings. The agrarian revolution in eighteenth-century England; the industrial revolution in all the major nations of the Western World saving perhaps Russia and Spain; the political revolutions and the democratic movements of the last century and a half; the new means of transport and communication; wholesale world-wide immigration; socialism; the development of political economy and sociology; trades unionism; coöperative and municipal enterprise; and the emergence of the State as a positive welfare agency—these are the signposts along the way. It is indeed an amazing history, a record of turmoil and conflict, of feverish activity and hectic imaginings, of stupidity and heroisms, reason and blind worship of cherished fallacy. But this whole record is shot through with a distinct thread of social philosophy, no less striking because not always explicit. It is that thread which

we want now to pick out and examine as a guide to formulating for social workers the social unfolding since the middle of the eighteenth century.

In the year 1789 the French Constituent Assembly published to the world its famous declaration called The Rights of Man; and Thomas Paine two years later renewed the challenge in his famous pamphlet aimed at Edmund Burke who, in a reactionary frame of mind, had ventured to criticise the French revolutionists and their brave declaration. As a matter of history, for at least three-quarters of a century Thomas Jefferson, The Declaration of Independence, the Constituent Assembly, and Thomas Paine seemed to have won out over Burke and other timorous conservatives of his day. The trouble was that while Burke was technically nearer the truth than Paine, his fears so colored his reasoning as to give it the appearance of prejudice and fallacy. There is no forcing of analogies or misreading of history when I say that *modern social-reform movements and social work represent a series of concrete attempts to define and redefine the Rights of Man*. They are the index of a growing self-consciousness about the expression of social "interests" in law and economic organizations. At times the social movement takes on the character of violence as in Chartism or the American Civil War or the philosophy and practice of syndicalism. At times it appears in the theory of class struggle. Still again it comes to light in the humble guise of a legislative plea for a living wage or for health insurance. But always it is the problem of rights, whether natural or acquired. And whether conscious or not, it is pretty generally aligned with eighteenth-century idealism and that vision of social justice crystallized in the famous trinity of social demands—liberty, equality, fraternity.

It is always fairly easy to formulate an indictment of social wrongs, but it is by no means equally easy to find a convincing way of righting them. If a people resents

the encroachments of its rulers and balks at being taxed it can say that governors rule and tax only by consent of the governed and that it has a "natural right" to revolt or regicide. If the ruler on his part suffers from dynastic egotism he may talk familiarly of *Ich und Gott* or may attempt to crush incipient revolt by announcing that he rules by natural right—the divine right of kings. If one objects to being consigned to the Bastille without any other warrant than a courtier's jealousy he may announce his natural rights to life, liberty, and the pursuit of happiness. If he is discontented with his wages he may claim by natural right a living wage. If a capitalist objects to income taxes or legal limitation upon profits he may appeal to his natural right to make what he can. If a saloon or other public nuisance is closed up or destroyed by prohibitory law its owner may demand compensatory damages by natural right. Such cases could be multiplied almost indefinitely. They all suggest the need of definition. What is a right, a natural right, an inalienable, imprescriptible right? Are rights always rights? Are all rights equal rights? Is a right in time of peace equally a right in time of war? Are we born with rights or do we achieve them? Is might right, and if so, whose might? Who or what is the final arbiter of rights?

There is scarcely any other field in which human opinion plays so fast and loose as in this field of rights. Not all men, of course, are quite so absurd as the student who defined natural rights as "the rights or privileges which we enjoy after birth." Another student was perhaps somewhat nearer the truth in her definition of rights as "the things which one man thinks he has and others think he hasn't." Turgot, the eighteenth century French philosopher-statesman, saw the connection between wants and rights but failed to show how the connection really came to be made. He said, "God by giving to man wants and making his recourse to work

necessary to supply them, has made the right to work the property of every man." This is good socialism of the early type, but it is poor sociology and savors of creation by divine fiat. Blackstone's "Commentaries" gave the legal definition of rights as "a number of private immunities" which are either, he says, "that *residuum* of natural liberty, which is not required by the laws of society to be sacrificed to public convenience; or else those civil privileges, which society hath engaged to provide, in lieu of the natural liberties so given up by individuals." The definition is sound so far as it accounts for rights in terms of social expediency; it is fallacious in so far as it conceives society to be a conscious contract. Long ago the theory of society as conscious contract was exploded. We now understand that society is mental organization almost as spontaneous and unconscious as the growth of a plant or animal.

The modern writers on politics and sociology have struck pretty directly at the heart of this matter. Professor Sumner declared that the *mores* can make anything right. This might justly be paraphrased into saying that custom can make any act or function a right; or briefly, customs make rights. In another place Sumner says, "Rights have come to be expressions of the rules of the game in the competition of life. . . They are not absolute. They are not antecedent to civilization. They are a product of civilization, or of the art of living as men have practiced it and experimented on it, through the whole course of history." A great historian of politics hits the target even more squarely with his definition of a right as "a power enforced by public sentiment," and especially by his comment that "a right is really the creation of public sentiment, past or present." In his own charming way Huxley, during his controversy with General Booth and the Salvation Army, illuminated this whole problem of the social creation of rights. "I cannot speak of my own knowledge," he says, "but I have

every reason to believe that I came into this world a small reddish person, certainly without a gold spoon in my mouth, and in fact with no discernible abstract or concrete 'rights' or property of any description. If a foot was not, at once, set upon me as a squalling nuisance, it was either the natural affection of those about me, which I certainly had done nothing to deserve, or the fear of the law which, ages before my birth, was painfully built up by the society into which I intruded, that prevented that catastrophe. If I was nourished, cared for, taught, saved from the vagabondage of a wastrel, I certainly am not aware that I did anything to deserve those advantages. And, if I possess anything now, it strikes me that though I may have fairly earned my day's wages for my day's work, and may justly call them my property—yet, without that organization of society, created out of the toil and blood of long generations before my time, I should probably have had nothing but a flint ax and an indifferent hut to call my own; and even those would be mine only so long as no stronger savage came my way."

Now if we summarize this conception, we may define a right as an interest that has been approved, selected, tested, and generalized through social experience. In other words, society creates rights. Or, put in another way, rights are privileges which have the O. K. of society. Rights are only natural as society itself is natural. Since rights grow out of the exigencies of group life and are indeed its product, it is evident that organized social purpose and activity may abridge, amend, or add to the existing sum of rights. Bentham and Austin held that there could be no such thing as a right which was independent of the State; but this is not strictly true. The State as the most powerful form of social organization tends to become the final arbiter in defining what is right or wrong; yet at the same time it does not decide in a vacuum, but rather upon the basis of past expe-

rience and proven or assumed expediency. The reference is always to general social experience.

A right, then, is a privilege conferred by society and sanctified by expediency. But is a right always a right? Here we touch upon the ethical no less than upon the historical aspect of rights and interests. Phillips Brooks we remember said, "No man has a right to all of his rights." And the reason is that some rights are righter—that is, apparently more expedient than others; just as some interests are higher than others when measured by certain standards. The altruistic interests stand higher in the culture scale of either individual or group than the interests in sex or beefsteaks or bridge; that is, if we admit the existence of such apparent facts as conscience, character, progress, humanity. And rights vary from age to age because wants and interests shift or rise. Hence the conflict between conservative and progressive, standpatter and radical. The conservative insists upon maintaining present or past rights, present comforts. The progressive sees new and wider interests or rights in the future; since for him the good is enemy of the best he is willing to forego and even trample down merely right rights for righter rights. He is especially interested in harmonizing old interest-conflicts and in widening to the uttermost limits the participation of every member of a group in the satisfaction of his legitimate wants through the proceeds of the common toil of all. This is the sum and substance of the plea for social justice.

This analysis makes it quite apparent that rights are only beliefs about human welfare and that they are neither self-evident nor self-justifying nor unchanging. Individual rights are always limited by contemporary questions of public policy or by the conflict of other rights. It will probably scandalize the man in the street, particularly the propertied man, to learn that he has no absolute natural right to land, profits, interest, or private

property of any sort and that those so-called imprescriptible rights have validity only in so far as they promote individual and social well-being. But the moment you attempt to handle political, economic, or international problems with a legalistic mind, steeped in the doctrine of natural rights, you land in confusion, disaster, and anarchy. Our own social muddles and the present international catacyclism will not be settled upon the basis of crude, absolute right, but on a basis of livability.

Granting that there are no such things as absolute, natural rights, there still remains the problem of extending the area of what we believe to be social utility and personal expansion. Unmistakably, many different methods of approach are possible in the attempt to work out what is livable, useful, and attainable through either legislation or so-called case work in the achieving of these new ideals of expanding the social spirit. Not all of these methods are equally valuable. They range all the way from pure sentimentality to the delusion of direct action and violence. In urging that a constant pressure to redefine rights is at the same time a movement to revise the general concept, "humanity," one must constantly be on guard to discriminate between humanity and what old Uncle Everard Romfrey called "humanitytomtity." That discrimination will appear in our analysis of sentimentality. Likewise, the cause of human rights is not to be served by indiscriminate attack. I am reminded here of the English schoolboy who wrote in his examination paper that "All geometry begins with a general denunciation." There are certain canons of common decency and of effective agitation which apply even to a pseudo-democracy corrupted by yellow journalism.

Another form of disservice to the social movement for enlarging human rights is mere busybodying. Rabindranath Tagore says somewhere, "Either you have work or you have not. When you have to say, 'Let us

do something,' then begins mischief." It is just this attitude which has caused a good many indiscriminating people to lump together the real apostles of human rights and the mere camp follower or bushwhacker. There are also not a few so-called reformers who through false credentials have secured entrance into the lists of the real reformers and social workers but who soon reveal themselves by their superficiality and their fads. I struck a gathering of these people not long ago at a congress devoted presumably to the subject of social purity. Rarely have I seen such an exhibition of twaddle versus science, or of meddling Pharisaism and complacency. Such men and women are not likely to do much for the enlargement of human freedom.

There is still another method of freeing men from social wrongs and clothing them with new rights, and that is the familiar method of direct action. The I. W. W.'s have no priority rights nor patent upon this method of social reform by violence. Peter the Great stands as one of the great exponents of this method of quick and inexpensive reform. After his sojourn in Germany, Holland, and England, we are told that he returned to his capital convinced "beyond a shadow of doubt that the one abiding error in his country's ways was conservatism." With a good deal of penetration he attacked the problem first through externals. Thus, on the 26th of April, 1698, he called together some of his chief leaders in a little wooden hut at Peobrazhenskoye and there by his own hand deliberately clipped off their beards and mustaches. Later, he passed a series of sumptuary laws forbidding certain ancient costumes and prescribing the apparel of Western Europe. That was his method of treating with conservatives when he was faced with the question of redefining the rights of the Russian gentleman. And it must be admitted that in the heat of conflict over a particular social measure, acts of violence and sabotage frequently creep in. This was true in Chartism; it was

true in the antislavery movement; and it has been true with certain wings of the modern woman-suffrage party. It is always present as a subtle temptation, for to smash a prime minister's window, or an abolitionist's printing press, or a miller's machinery always gives the sense of satisfaction in quick and substantial achievement. But a social worker or the social reformer need not have the slightest sympathy with such acts of sabotage and still qualify for Kirkman Gray's definition as "the perfect agitator." His heart may swell with sympathy as the result of his daily contact with grave social injustice. He may be moved to violence as a catharsis for his pent-up feelings. But he must forego the resort to such crude methods if he is to act as the mediator between the socially fortunate and the socially neglected. Such work of mediation demands that one's sense of perspective and one's clear vision of relative values must remain unobscured. To see red either chronically or spasmodically is not likely to make one a safe apostle of human rights.

The new "bill of rights" as fully enacted or in the process of enactment during the last hundred and fifty years is a very impressive sight. The right to freedom is perhaps the most outstanding of these new attempts to redefine human rights; and I mean by that term not only the abolition of negro slavery, but also the movements to abolish serfdom and peonage, white slavery, convict slavery, and wage slavery. These are all angles of the same fundamental human problem. A very considerable proportion of social energies during the latter half of the eighteenth and throughout the nineteenth century have been poured into channels leading toward the accomplishment of this vision of a freer human personality.

As a corollary to the right of personal freedom men have added the right to a decent income. You find this in the form frequently of a demand for a living wage.

Minimum-wage legislation for women and children has already met in part this demand. But there is a growing call for a widening of the concept to include all workers, men as well as women, unorganized as well as organized. The new demand made originally by the Fabian Society in England and taken up by the British Labor Party's program for social reconstruction after the war with its echoes at the National Conference of Social Work in 1918 has crystallized pretty definitely into what is called now the "platform of national minimums"; that is, certain minimum standards of health, wages, and other living conditions as they affect citizenship. It is a very fertile concept, and it proves conclusively the real nature of rights. It shows beyond question how these rights arise in localized opinion, are fostered through agitation, and are finally crystallized in popular conviction as expressed in constitutional amendments and statutory legislation.

Another significant corollary to the right of freedom is the right to organize for economic protection. The answer to this right is of course the whole trades-union movement with its gradual compelling of courts and legislatures to cast overboard the old doctrines of conspiracy and to recognize the right of peaceable assemblage, protest, and wage bargaining. How long this right is to be pressed will depend upon how long the possibility of exploitation lingers on in our industrial organization.

Another fundamental right now becoming more and more recognized is the right to leisure. This is based partly upon a perception that all advances in human culture have been made through leisure-time activities. It is also based upon the complementary fact that men can remain neither healthy individuals, sound parents, nor good citizens unless they have proper time for rest and recuperation. The social reforms to meet this newly demanded right are to be found in labor-union agitation,

in legislative acts and judicial decisions limiting the hours of the working day. The greatest single monument in this field is the famous brief presented by Mr. Justice Brandeis and Miss Goldmark in the so-called Oregon Eight-hour Case, *Bunting vs. The State of Oregon*. The "Pittsburgh Survey" offered a startling background against which to sketch in the need for adding this particular right to the social equipment of every normal individual. Not even the war and its preoccupation with intense industrial activity was able to set aside the conviction of the right of this demand for leisure. Indeed, it has been officially recognized in the notable series of studies upon fatigue in British munition plants. A decent working day and various forms of welfare and recreational work have been the war-time concessions to this insistent demand.

The right to education stands perhaps only second to the right to freedom in the great nineteenth century bill of rights. The enlargement and extension of systems of universal free public education, the creation of the public schools, elementary, intermediate, high, and university, with all their accessories, indicate how keenly the justice and the utility of this right have been perceived. But that this is not a natural right was clearly indicated in the arguments of English conservatives as late as 1870 in favor of retaining education as a private industry and against a state monopoly of the field.

As a connecting link between the right to education and the right to leisure stands the new right to recreation. This right is fundamentally a recognition of the imperious character of the play instinct, and an understanding that if this instinct is balked of legitimate satisfaction it will find its satisfaction in devious ways. The answer to this demand is found in the creation of public playgrounds, parks, municipal theaters, concerts, boys' and girls' clubs, settlements and social centers. The war has given an opportunity to demonstrate on a tremendous

scale the value of learning through decent organized recreation how really to "play the game." It has been said frequently that the fundamental difference in mental attitude between the German and the American is that the German does not know how "to play the game" because he has never fully perceived that this right to recreation was a community obligation.

Another whole series of new rights created by nineteenth century social perception may be united under the term "the right to health." I mean by this not only the right to public sanitation and the right to preventive hygiene, but also the right to protection from impure and adulterated foods. Many of these aspects of the problem were gathered by Mrs. Florence Kelley in her excellent little book, "Some Ethical Gains Through Legislation." But there are other health rights equally important. One of these in particular has been receiving increasing attention for at least half a century; namely, "the right to a decent habitation." This right is by no means fully won, for altogether too many people still think that if a person cannot afford to live in anything but a chicken house or a basement, it is nobody's business. We are learning that there is a level of housing decency below which no citizen, whatever his rank, shall be allowed to drop. This applies not only to private homes but also to joint houses, to tenements, to industrial camps, to lodging houses, hotels, prisons, and other public institutions. Here again the war has strengthened the position of the social workers and the housing reformers and has made it pretty clear that this fundamental right stands a good chance of attaining a permanent position in any bill of fundamental human rights.

We may consider just one more angle of the right to health. It might be phrased as "the right of children to a chance to start life right." That is, the right of children to a clean bill of health, to a parentage untainted by unnecessary and preventable diseases or degenera-

cies. It is this right to which at least a part of the modern eugenics movement addresses itself. But along with eugenics, of course, are to be marshaled all sorts of agencies from the Federal government down to the local home-finding society which are working for the protection and welfare of children. The Federal government with its Children's Year program in 1918 illustrated very clearly the perception of this right and also the realization that it is not a negligible part of the citizen's protective code but rather that it is a fundamental part of this supremely important right to health.

The history of the nineteenth century with its reform of poor law administration, with its various movements to abolish imprisonment for debt, to introduce the reformatory spirit into the prison system, to abolish capital punishment, and to provide more rationally for the care of delinquent children indicates a growing tendency to impute to the delinquent the right to a certain minimum of decent care. The point is not that the criminal is any less criminal than he used to be, nor any less deserving of all discipline and punishment, but that the community is too good, too prosperous, and too right-minded to tolerate anything less than a really humane ideal. The State as an evolved and civilized social institution cannot afford to indulge in the crude, primitive methods of torture and revenge; and just as it has outgrown through its very decency and its development those primal brutalities, so it tends to go a step further and establish certain new standards of positive decency in its methods of reclaiming "human scrap."

Somewhat the same situation is involved in the treatment of the poor, particularly through public administration. It is quite arguable, of course, that the poor, even the so-called unworthy poor, are just as shiftless and wastrel as they were in the days of Elizabeth. But here again the point is that the whole level of our standard of decency has risen measurably in the last three or

four centuries, and that we cannot tolerate from either public or private authorities any standard of treatment of any class whatsoever which is out of keeping with our minimum ideal of what any human creature should receive. This tendency to accord to the poor the right not only to relief but to decent relief with an ever rising standard of decency, accounts for the often noted fact that while the number of the poor apparently decreases, the cost of maintaining them does not always decrease but rather tends to rise.

One of the most significant extensions of human rights which we have been witnessing, particularly in the last twenty or thirty years, is the recognition of the right of women to full equality in all social life. This appears in various guises. You meet it in that broad current of mixed motives and purposes sometimes called feminism; you find it in the organized suffrage movement; you find it in the women's trade-union league; you find it most recently in the various methods by which women have thrown themselves into war service. No better illustration could be offered than the woman's movement of how a right, no matter how "natural" it may be, has to be achieved through agitation, education, and the production of an irresistible conviction that the extension of such a privilege is essential to the highest social welfare. It also illustrates the same thing from another standpoint, namely, that many people are anxious to concede this right to women in order to be at peace and in order that the restless energies of women now absorbed in winning suffrage and other forms of recognition may be poured into channels for constructive social effort.

I have been speaking so far mainly of individual rights, the rights of the citizen. But there has been also a tendency to enlarge a concept of the rights of the community, which we are learning to recognize under such terms as social control, the police power of the State, the social-welfare function of government, and the commu-

nity right to self-protection. It is implicit also in such ideas and movements as eugenics and conservation. For example, various voices arise from time to time asserting the right of the community to protect itself against criminals and defectives by cutting them off through segregation, birth control, sterilization, and other forms of negative eugenics. These suggestions have not yet taken full form as community rights, and the reason is, we say, because public opinion has not yet crystallized itself fully in their favor. This illustrates clearly both the twilight zones from which all rights emerge and also the method by which they are brought from twilight into full sunlight.

A very remarkable extension of the right of the community through its inherent police power may be seen in various legislative, judicial, and executive acts to prevent poverty, disease, and crime through prohibiting certain harmful agencies like the saloon, the house of prostitution, lotteries, race-track gambling, the sale of habit-forming drugs, and patent medicines. So thoroughly is this sense of right becoming ingrained in the public mind that only here and there does one hear any longer of compensation for destroying any of these noxious businesses. This idea of the abatement of public nuisances bids fair to have a wide extension. Some of the more positive aspects of this police power will appear in more striking and detailed form in a later chapter on the trend of social reform.

Finally there is a tendency to a very much broader and more comprehensive framing of community rights which is attaining a wider and wider public interest. We might put this down as the right of the community, present and future, to an unimpaired heritage of healthy citizens and of a productive domain. From one standpoint, this right summarizes all other rights both individual and social, and in a sense may be said to epitomize the whole of rational social policy. May the day soon

come when these rights will not be mere words nor mere laws falling into desuetude, but when they may form the charter of our liberties and when they may become the solid basis upon which a finer superstructure of civilization may be erected. Meanwhile, let them serve as lighthouses for the social worker as he steers his course through the troubled currents of modern social life.

CHAPTER II

THE PHILOSOPHY OF SOCIAL BETTERMENT

To round out an adequate concept of "rights" and to smooth the approach to a scientific view of social work it is necessary to formulate a more coherent philosophy of social betterment. This involves primarily a brief review of some theories of the relation of the individual to the social group. Thus only can we arrive at the basic sanctions for social-welfare activity or assess responsibility for its costs and conduct.

It is doubtful if any of us are still such outrageous optimists as to argue for the present world as the best possible of all possible good worlds. Our common sense and our scientific analysis agree that there is room for improvement. But as to who or what needs improvement or who should make it, or whether it makes itself by an inevitable tendency to perfection, there may be considerable divergence of conviction. Personally I am unable to rest my faith in the perfectionist doctrines of eighteenth-century Turgot and Condorcet or their nineteenth-century representatives, Bachofen and Wergeland and Pelletan. Man has no incorrigible hankering after perfection, nor is he guided in the direction of improvement by an irresistible force, as the spirit is supposed to impel the hand of a medium at a seance or direct the scribe in literal dictation of inspired scriptures. Man wills to improve when he wants to improve. Progress is voluntary after we leave certain low levels of culture. Social betterment, then, is not something imposed by Powers above, but an attitude of human minds, sentiments, and wills.

We are speaking here of social betterment, not individual improvement, though the process in either case is identical. But who is charged with social improvement? Is it everybody's business, or that of kings, priests, councils, and legislatures? Is it something savoring of universal duty, or is it merely a luxury to be enjoyed by a favored few, as leisure, wealth, or whim suggest? The answers to these questions range themselves into two pretty clearly marked groups which we have got into the habit of calling respectively individualism, and altruism or mutualism. On the one hand we have, say, Sumner's essays on "What Social Classes Owe to Each Other," with their general text that "to mind one's own business is a purely negative and unproductive injunction, but, taking social matters as they are just now, it is a sociological principle of the first importance. There might be developed a grand philosophy on the basis of minding one's own business." Or we might turn to Max Stirner, the most uncompromising individualist of the nineteenth century, in his "The Ego and His Own." "Thousands of years of civilization," he declares, "have obscured to you what you are, have made you believe you are not egoists but are *called* to be idealists ('good men'). Shake that off! Do not seek for freedom, which does precisely deprive you of yourselves, in 'self-denial;' but seek *yourselves*, become egoists, become each of you an *almighty ego* . . . if the State is a *society of men*, not a union of egos each of whom has only himself before his eyes, then it cannot last without morality, and must insist upon morality. Therefore we two, the State and I, are enemies. I, the egoist, have not at heart the welfare of this 'human society,' I sacrifice nothing to it, I only utilize it; but to be able to utilize it completely I transform it rather into my property and my creature,—*i. e.*, I annihilate it, and form in its place the *Union of Egoists*."

On the other hand, we are met with Comte and his sociology culminating in the religion of humanity; with

the philosophy of solidarity which characterizes the France of the Third Republic; with State Socialism; with such books as Dr. McConnell's "Duty of Altruism" or with that whole more or less vague and spontaneous body of attempts to formulate and utilize good will which we may call social-welfare movements. Let me illustrate with a handful of maxims from Auguste Comte's writings. "The perpetual aim of human life: the maintenance and improvement of the Great Being, whom we must at once love, know, and serve." "Devotion of the Strong to the Weak, Respect from the Weak for the Strong." "The whole human problem consists in establishing Unity, personal and social, by the constant subordination of selfishness to Altruism." "With all our efforts, the longest life well employed will never enable us to pay back more than an imperceptible part of what we have received." "The Education of the Race, like that of the individual, prepares us gradually to Live for Others." "The characteristic of Education is this, above all: a Being naturally inclined to live for self and in self is to be made disposed to live for others so as to live again in others by others."

This is of course the age-old philosophical problem of the One and the Many; stated in its newer form it is the question of the relation of the individual to society. The attempt to harmonize these two presumed opposites is, I believe, the essence of the "social question." And if we agree that this is "the age of the social question," it is because the age is striving to reconcile the interests of individual and group. But can they be reconciled? Is the proposition as definite as a problem in arithmetic, with only one valid solution? You remember that even in arithmetic Sir Roger de Coverley found much to be said on both sides. And there is the story of a Yale professor with the proper academic open mind who was stating the evidence for the existence of God. Some persons, he said, hold that the Divine Being exists;

others, that He does not; the truth lies halfway between. But can the truth about the individual and society be stated in this catholic way? Let us see first whether the two terms are really in opposition. It may be that the problem is improperly framed and that we are forcing doors that are already open. This will involve defining what we mean by "individual" and "social" or "society."

Suppose we begin by saying dogmatically that there is no real opposition between individual and society; but that both words represent different aspects of the same thing. Is the individual created primarily for society, or society for the individual? Neither. Which is prior in time or importance? Again neither. Like the "halves" in Plato's Symposium they are complementary and indispensable to each other. They are the same thing. They are merely two of the perhaps many modes in which the creative impulse has chosen to express itself—both equally valid and equally useful. Bergson in his "Creative Evolution" has stated this matter comprehensively, and since we are discussing philosophy, it may be permissible to quote him: "A part is no sooner detached than it tends to reunite itself, if not to all the rest, at least to what is nearest to it. Hence, throughout the whole realm of life a balancing between individuation and association. Individuals join together into society; but the society, as soon as formed, tends to melt the associated individuals into a new organism, so as to become itself an individual, able in its turn to be part and parcel of a new association. . . . But this itself (speaking of polyzoism in lower animals) reveals to us, in the genesis of the individual, a haunting of the social form, as if the individual could develop only on the condition that its substance should be split up into elements having themselves an appearance of individuality and united among themselves by an appearance of sociality. There are numerous cases in which Nature seems to hesitate

between the two forms, and to ask herself if she shall make a society or an individual. The slightest push is enough, then, to make the balance weigh on one side or the other. . . . The evolution of life in the double direction of individuality and association has therefore nothing accidental about it; it is due to the very nature of life."¹

As I have shown elsewhere,² in human society nature seems to have solved the puzzle by creating the individual's real self out of the stuff of society, and on the other hand to have trusted to variations in the individual for the constant renewing and freshening of the social mass.

So far as I am able to make out the philosophical individualist's position, it is something like this: I am created different from everything else, I am individual, unique, inexplicable. By the law of nature I am permitted, even required, to magnify and perfect that difference, my own unique nature. Hence I invoke a combination of the scientific doctrine of selection of favorable variations with the metaphysical doctrine of natural rights; by virtue of this combination, I myself, the unique variation, am constituted the selector. The position of the individualist appears then to be an unwarrantable extension of the eudonomic theory of divergent evolution, *i. e.* the inherent power in different individuals of the same species to deal in different ways with the same environment.

On the other side of what seems to be at first view an impassable gulf appear a great body of scientists who utterly repudiate such an individualistic conception of human nature. The social psychologists, Tarde, Durkheim, Trotter, MacDougall, Baldwin, Cooley, Thorsch, Boodin—indeed nearly every sociologist and all the philosophers who have taken the trouble to investigate social

¹ "Creative Evolution," pp. 251-252.

² "Theories of Social Progress," Chap. IV.

processes—find the individual born of society, caught in its matrix, as much in and of it as though he were a drop of water in the Gulf Stream. Professor Cooley states the situation very clearly: "To many people it would seem mystical to say that persons, as we know them, are not separable and mutually exclusive, like physical bodies, so that what is part of one cannot be part of another, but that they interpenetrate one another, the same element pertaining to different persons at different times, or even at the same time: yet this is a verifiable and not very abstruse fact. . . Man's psychical outfit is not divisible into the social and the non-social . . . he is all social in a large sense, is a part of the common human life."¹

The so-called "organic" school of social theorists put the matter much more positively. In their hands the individual is a mere biological atom, a bit of social protoplasm with no more and no less independence than a cell in a jellyfish. This far I cannot follow, for society is really mental unity, mental organization rather than a biological organism. But no social worker need hesitate to go at least as far as certain clear-sighted health workers, and he dare not hold back behind them. Let him go to Milan and visit the famous clinic for occupational diseases: he will find his true philosophy cut in stone, for the corner stone of that clinic bears this motto, "*In aliis vivimus, movemur, et sumus.*" In others we live, move, and have our being. Or let him read Witter Bynner's "*The New World*" for a somewhat mystical rendering of the same philosophy in noble verse. Or let him listen to old Walt Whitman roll out his "*For You, O Democracy*":

"Come, I will make the continent indissoluble
I will make divine magnetic lands,
With the love of comrades,
With the lifelong love of comrades.

¹ "*Human Nature and the Social Order*," pp. 12, 61, 90-1.

I will plant companionship thick as
trees all along the rivers of America,
and along the shores of the great
lakes, and all over the prairie.

I will make inseparable cities with their arms
about each other's necks,
By the love of comrades ,
By the manly love of comrades."

It is now time to clear up our definitions. In the first place both *individual* and *society* are abstractions. Socrates offered his weeping friends the prospect of a merry race in their search for *him*, the real Socrates, who to mortal appearance was about to be killed. Likewise if you go on the still hunt for the individual you are foredoomed to illusion and disappointment. You will discover that the individual is only a convention, a concept. Put him under the microscope and you will melt him away into an infinitude of molecules or atoms that are dancing about with partner molecules or atoms from the air, the earth, or other living creatures. Analyze his mind, his self, and you will find that there is no individual there but only a multitude of potential individuals held together by the exigencies of the moment. Analyze again those potential individuals and you will find them to be strikingly like ideas and potential selves you have met before. You will conclude that your individual, like Ulysses, is part of all that he has met. You will find that he is individual in the morphological sense; for instance, he will have a set of finger prints quite unique. But I am sure you will not be content with the definition worked out a while ago, that the individual is merely "the detached and solitary human monad hermetically sealed in two hundred pounds of acquisitive avoirdupois." You will refuse to define him in anything but really human terms. You will find that your individual is a composite mixture of his mother's body, his father's

temper, his grandfather's love of horses, his brother's resentment at having the bedclothes pulled off, his nursemaid's fear of ghosts, his teacher's love of polished shoes, his gang's predilection for running when a policeman appears, the American youth's tendency to overdress and to drop the *ing* from his participles, the business man's philosophy of success, the preacher's fear of hell, and the saint's vision of heavenly glory. His language, his ideas, his standards of living, his codes of honor, his whole outlook upon life are borrowed; they are in no sense native, they are every one acquired; and they are what make him man, an individual man. We call him an individual man by courtesy. If he insists that he is an irreducible, unique center of acquisition, we deny him even that dubious right; we show him that he is simply a bundle of cells which are hungry, and a congeries of ideas that think and move. He is merely a convention.

If he calls evolutionary zoölogy to witness, we can show him that natural selection chooses species, not individuals. From the standpoint of human evolution it is significant that it was not the gorilla living more or less apart, but his much weaker cousin, the social monkey, that was elected to so honored a position in our genealogy. On every hand you find evidences of social solidarity in the sub-human world. "Not only are species interdependent as well as partly in competition, but there is an absolute dependence in all the higher species between its different members which may be said to imply a *de facto* altruism, as the dependence upon other species implies a *de facto* coöperation. Every animal, to say nothing else, is absolutely dependent for a considerable part of its existence upon its parents."¹

Moreover, every higher species has certain so-called race instincts that have apparently nothing to do with the life or welfare of the individual. Indeed they are

¹ Leslie Stephen, "Social Rights and Duties," Vol. I, p. 234.

only intelligible when translated into terms of group interests. Such are the mating or the parental instinct, and the impulse to rush to the defense of comrades or the weak and helpless. We might add, too, such a strongly marked instinct as the impulse to toss alms to every beggar. I should not want to be misunderstood as basing rational and advanced civilization upon mere group instincts; far from that. But these illustrations go to show at least that society is not, nor never was, a free contract between separate human monads endowed with a full equipment of natural rights. Let us reiterate now that from the evolutionary point of view human rights or the rights of the individual are not *rights* at all but rather *social privileges*, arising out of, and sanctified by, group experience and conferred by the group for its own welfare. *The individual is not, then, a natural product; he is a product of civilization; and civilization is social achievement.*

But the individualist may refuse to rest his case upon natural science and evolution. He may insist that however naturalistic sociology may strive to identify the individual with the group, religion disengages the individual and makes the unit soul the end and aim of creation. But at best the evidence from religion is conflicting. Totemism, the ancestor cult, reincarnation, and group responsibility for sin are the prevailing marks of primitive religion. The first gods were group gods. And God is still accused of scourging whole communities for the misdeeds of certain of their members. Christianity, it is true, summons men to the care of their own priceless inalienable, individual souls. "What shall a man give in exchange for his soul?" (*Mark* viii, 36). Here is extreme, irreducible, individualism. Its flower came in subjectivism, the right of private judgment espoused by the Protestant Reformation; and its seed, the multiplicity of Christian sects which the modern idea of federation is trying to weld once more into a coherent mass. But in

spite of this fact I believe we may say that the most original and engaging idea of Christianity was not the value of the individual soul, but the concept of the Mystic Body. The metaphor of the vine and its branches states the same concept of organic unity and association. Again, the marginal rendering of the familiar text "The kingdom of heaven is within you," which makes it read, "The kingdom of heaven is among you," has been emphasized as the real spirit of early Christianity. Something may also be guessed from the scanty references to primitive Christian communism. The evidence from religion proves to be a boomerang; for the appeal is always made not to your or my private ideas of religion, since they would not be accepted in the forum of discussion, but to religious bodies, or platforms of religious dogma, or to religious teaching. But all these spell organization, authority, and the subjection of, or rather the inclusion of, the individual within a doctrinal circle. The individualist in his appeal to Christian dogma gets entangled in the very meshes he would escape.

The individualist may take his final stand on the highlands of transcendental philosophy. There, of course, we cannot follow him. He is safe; for there, as in the wonderland of Alice and her looking-glass, anything may happen. He is in the heaven of the Absolute. He is safe so long as he stays there. But if he grows hungry or cold or interested or communicative or anything, in short, but pure contemplation contemplating contemplation he is down in the midst again. In the midst of what? Of you and me! He resumes his personality, he lives once more, because he lives in us and we in him. He finds his real life in that very conventionality and abstraction which deny him an absolutely unique self.

It would appear, however, that there are individuals—at least near-individuals. I can conceive of one type, those transcendentalist and momentary individuals which we have just indicated. And I have actually seen

the only other type known; namely, the gelatinoid defective such as we house in institutions for the feeble-minded. The idiot is as near the pure individual as we are likely to get in this world; and he would perish in a week if left in company with like individuals. His only chance of life is the social nature and the physical soundness of the rest of us. Even the criminal who is commonly considered as an extreme individualist and antisocial is social in spite of himself; for he lives off and through society, and usually has gang ties, or ties with women. Try as he will, then, no man liveth unto himself. We are hopelessly part and parcel of each other. The term individual becomes, consequently, mere shorthand for the phrase "a working unity of ideas derived from social experiences." And the feeling of individuality comes from the stress of competition between ideas and impulses derived from the various association groups of which we are a part.

Now, turning to society, we find it no less an abstraction than the individual. It is a conventional shorthand way of saying "association of interest-groups," or "large organization of smaller groups." But what is organization? It certainly is neither place nor thing. It is merely relation. Society is relationship, mental community. And it has no existence apart from the individuals who furnish the occasion for relationship. It is quite indisputable that if all the ninety-two odd million persons who made up "society" in the United States at the Census of 1910 suddenly died in a night like Sennacherib's Assyrian host, there would be no American "society" left in the morning. But, on the other hand, if there were no such thing as American society, no American could live.

By society I understand mental community, community of thought, sentiment, interests, ideals, fears, loyalties; mental integration. Society is a zone of like-mindedness. A society, to use the popular term, is merely a group of persons who are like-minded. This does not

mean that they are like-minded in every respect. One man may belong to a dozen or a thousand societies. A popular, ambitious man at college is likely to wear a vest front full of insignia designating him as a member of various so-called honor societies. The big group that most people think of as society is a web of almost countless strands of lesser societary groupings. A man is a member of as many societies as he has interests, and society in the big is merely the integrated sum of this play of interests. By man's social nature, then, we mean only that he has interests created by group life, or interests which only group life can satisfy. It would not be difficult to show that all man's higher interests, also his sexual interest (which, by the way, is a race and not an individual interest), and even for the most part his self-maintenance interest cannot be satisfied outside of group life. Hence it is fallacious to assume, as, for example Benjamin Kidd did, that the interests of the individual and the interests of the group are "inherently and essentially irreconcilable." These interests are reconciled in actual life every day, else society would dissolve and its members along with it. So far is it from the truth that individual interests are irreconcilable with group interests, that actually the opposite is the reality; for it is the reconciliation of individual interests that creates social groups in the first instance, and maintains them in the second.

So much clearing of ground seemed necessary before addressing the real problem at issue; namely, what is a man's duty to society? That is the kernel of the "social question." A good deal of vaporizing has surrounded the word *social*. Most of us have been convicted of using the word hazily or with mental reservations. I plead guilty to having written of *socializing* the engineer, of *social* education, and of the *social* church. I find that the word sometimes refers to the problem of capital and labor, or to the problem of prostitution, or to

general ethics, or to the widening of opportunity for the individual. All that I mean by the word here is summarized in the recent answer of Professor Small to the challenge that we take account of stock with regard to this adjective. He says: "The plain matter of fact with which all our sociologizings start is that no person exists in a moral vacuum. Contradiction of everything like a moral vacuum conception of the lot of persons is the sum and substance predicated in all accurate uses of the term 'social.' That is, every person's life touches other persons' lives. . . . A 'social point of view' means consideration of the whole problem as an affair of the effect upon all the persons concerned of each possible alternative, and choice of action in accordance with the estimated balance of interests."¹

From this standpoint a man's social duty is first to recognize that he is a social product, a loan, so to speak, from the common bank, which, for want of a better word, we may call the *social mind*. Second, consequently, that he must order his relationships, his society, in such a way that he may make the largest possible contribution to the common bank from which he got his "start." It is manifestly impossible for a man to choose his company in the absolute sense which individualists urge, for a man inherits by far the larger part of his company. "The living," said August Comte, "are more and more governed by the dead." Renan and LeBon have both demonstrated the power of the "dust of dead gods." But in a more limited sense a man chooses his society. Since he cannot live without a society he is likely to choose one ready-made or the first one that happens to satisfy the interests of the passing moment. Hence primitive groups were chiefly food and sex and defense groups; and their modern prototypes far outnumber all other forms of association. But since some of

¹ "American Journal of Sociology," Vol. XIX, pp. 654-5.

these primary interest-groups may easily become dangerous to the interests of the larger group, some form of control, perhaps even of coercion, is necessary to bring about their adaptation to the larger need. Hence probation officers either break up or modify gangs of juvenile delinquents in spite of the fact that they are perfectly natural and spontaneous associations. And police destroy organized bandits or associations of thieves or Black Hand societies, though again they are natural interest-groups.

It is evident that some form of interference must regulate the relations of constituent groups to the bigger thing we call society in the large. In other words, standards of value must be set up and applied to acts of groups as well as those of individuals. Those groups whose acts menace the whole must be suppressed; those that further the whole encouraged. Hence the work of government, and by consequence that of rational education, is to develop in the individual standards of valuation that will incline him with as little coercion as possible to select those associations which will minister to the welfare of the whole, and by reflection to himself. I do not mean by this, certainly, that the State is necessarily that higher group for which the individual ought to be fitted. Nor do I mean that sense of obedience to law is the sole test of social fitness. Emerson declared that the highest virtue was always against the law; but nevertheless he compromised and paid his taxes, without loss to either himself or his fellows. The quality of a society may perhaps always be measured by the number and character of its heretics, provided always that their heresies are not suicidal like blind Samson's. But the heretic is not an individualist. He is always looking for a new and better *society* than those of which he is made. He may refuse to conform to clothing group A, or food group B, or religion group C, or political group X, Y, and Z. But it is always because he is trying to cast his lot

with ideal groups A¹, B¹, and so forth. He is not trying to dodge social responsibility; he is trying to create new types of social responsibility and to urge others to assume those responsibilities by joining with him in his Utopia or his New Jerusalem, or his great Free Spontaneous Commonwealth of Anarchism.

It is evident, then, that the philosophy of social betterment and social work must take some such view of the relation of the individual to society as we have sketched. Since association is still partly coercive, partly voluntary, social reform and social work must utilize both types of measures. But the tendency should be more and more to eliminate a social solidarity based upon constraint and to develop voluntary and contributive types of association.

Since, however, only complete knowledge is virtue, and since for a long time to come no individual or interest-group can compass complete knowledge of the effects upon others of its desires and acts, some authority for interference and review must be lodged somewhere; and however crude or unsatisfactory it may seem, that authority must be lodged in the real leadership of the larger group. Hence the individual must learn the negative virtue of obedience and adaptation, even of subordination and renunciation.

The individualist has never been able to make out a convincing case for his thesis that no relation but one of mutual advantage is desirable or ethical. His proposition is untenable unless couched in most transcendental terms. Neither does he convince that education must always be unconstrained and spontaneous. I suppose even the man who thought children should be allowed to burn themselves in order to learn the fundamental principle in physics and physiology that "fire burns," would not hesitate to put a screen around his open fireplace to keep his child from falling in. That screen gives away his whole case; it is likewise the symbol of all

good social work. He argues for training to think for oneself; in other words, for the open mind. But can he not see that this training is the most severe régime of discipline through which child or man can be put? The reason why the altruist urges originality and the open mind is that such minds are a social asset, in that they are contributive rather than purely adaptive or dependent. We must get away from the idea that to think in social terms is stagnation. Or that group interests are served by sheep minds. Or that progress is due to the unconstrained and unrestrained activity of individuals. Who will maintain that self-seeking is maintaining the open mind? Is it not rather a sign of mental squint? If self-seeking be the spring of progress, the society that has the largest number of criminals is the most progressive.

Nor is individual invention to be taken as the measure of progress unless some organized power exists for the selection and protection of the inventor and his product. Pure self-interest and individual exploitation simply mean that the big gorilla inventor will snuff out the little chimpanzee inventor and destroy or steal his invention. For example, a good many years ago an inventor patented a remarkable improvement in rifles. His self-interest prompted him to sell the patent to a firearms manufacturing company. The company found that the improvement conflicted too seriously with the type of gun they were making and marketing, so suppressed it in their own self-interest. The inventor is still waiting for the promised royalties. Nobody knows how much latent or active genius has been suppressed in just this way. Instead of less interference, such cases suggest measurably more power of social review.

It is true that the individual creates; but his creation avails nothing without some power to preserve his creation; and that power lies in the group. Society stores up the power generated by happy variations in its members. Law, a social product, is one of the means by which

this storing and conserving process is made possible. And it is this very storage of material and spiritual achievement that releases the individual of to-day from having to work painfully through the history of the ages. In short, social heredity, the storage battery of past achievement, creates the individual of the present. And that social heredity is the record of the selection not only of differences and spontaneous variations, but of similarities in individuals, and of successful methods of social control.

But the individual's duty to the group is not satisfied by a mere policy of noninterference, or of passive indifference. Most of the individualists I know have stood for the simple policy of "you let me alone and I'll let you alone." As if it were possible! A cannot be let alone by B however passionately he desires it. And with the very best show of consistency possible A cannot and in fact will not let B alone. My colleague X believes in cultivating his mind, loves to tramp in the high mountains "where only man is vile," loves to eat and drink, eschews all ideas of career, denies that he has any social responsibility or that he *ought* to do anything he does not want to do; his chief aversion is steady work; he stoutly maintains that he wants everybody else to enjoy the same freedom from responsibility he enjoys. What is the result? His father and his friends pay the bills. He has involved B whether B wanted to be involved or not. Suppose, again, that A has a child which he proposes to rear according to the principle of spontaneous budding of intellect and character. He will avoid correction, warnings, and all measures of formal interference or show of authority. A's wife or friends soon begin to pay the bill in worry, in broken furniture, in embarrassment over the antics of a young savage. The child itself will probably not thank its sire for his *laissez-faire* policy. And the community in the long run will have to supply the needed element of control which the parent might have given at much less cost in time and suffering. Individ-

ualism too frequently simply means laziness, or self-indulgence, or a downright policy of self-aggrandizement at the expense of one's fellows. And no complacent philosophy of mutual hands off can gloss over this fact.

The positive aspect of a man's duty to his social group is no less emphatic in its claims. I deny by anticipation the innuendo that the duty of positive social service is merely old-fashioned charity or "dead men's shoes." That is too close to the cynic's creed, as expressed, for example by Samuel Butler, the vitriolic painter-novelist. "Can anyone," he asks, "do much for anyone else unless by making a will in his favor and dying then and there?" Charity is often simply an attempt to plaster a sore; constructive social service is paying back into the common fund the capital which has made us what we are, with a reasonable interest which may be used to swell the common fund for the benefit of others and perhaps of ourselves. A man's minimum duty is the support of himself and of those obviously dependent upon him. But the group may justly demand something in addition for the progressive welfare of the social whole. Surely at this date I do not need to go into the individual benefits to be received from community activity for health, safety, recreation, or culture. Huxley in his essay on "Administrative Nihilism" and Edmond Kelley in his early work, "Evolution and Effort," scotched for good and all the serpent of individualism in these respects. But can the matter not be carried legitimately a step farther? May not social duty be stretched beyond the mere point of preventing danger, disease, crime, or a few cases of chronic pauperism, to the point of creating a social environment which will favor the positive increase of well-being for every member of a community? I think it can and must. The individual is by very definition committed to this task. He can only live out a rounded life, a free life, a unique life, by joining voluntarily in the common enterprise of social advance.

In such a statement of the philosophic base of social betterment sanctions it is not essential that we say just how the individual is to serve. The common principle of division of labor will attend to that. Naturally his first service will be rendered to the narrower and more pressing interest-groups to which he belongs. He will consider family, labor union, professional class, birth caste, religious or philosophical sect, and so forth before he rises to the height of caring for the higher integration of which these are but fragments. His chief service to these groups will be to lead them to feel their own limitations and to seek a more vital and organic unity with other groups. Little by little his own vision should broaden, and theirs; in time he should be able to compass in his imagination and in his sympathy that great Being, Humanity, which according to Comte is the only real individual. There is no need for sentimentality here; indeed there is not room for it. There is no sense of martyrdom, but instead an opportunity to demonstrate that probably there is economic and sociological truth in the profound sentiment uttered by Jesus that he who loseth his life shall find it. He who strives to enlarge his concept of life by renouncing the petty cultivating of his fondly perfumed ego will arrive at a sense of life and power undreamed-of and abiding.

As a matter of fact most of the programs of recent times bear the stamp of this philosophy. Socialism is the most avowed example. Socialism is right in its reaction against that species of individualism which has resulted in what it calls the anarchy of modern industry. The wisest socialists, least of all people, want slavery, dead levelism, or the extinction of personality. They want to clear the ground of the material hindrances to the development of a really adequate personality. They seek for a voluntary and contributive type of association which will look to the common good and joy in it. Hence the socialist aims at precisely the same target as his

individualist brother. But he is on somewhat surer ground; for he frankly accepts the social definition of the individual, and he recognizes the necessity of having some organized power to review social survival values. The chief objections to socialism are, it seems to me, its methodology of class struggle, and its too rigid concept of sharply distinct classes. The theory of class struggle is a too easy excuse for blind fury and destructive violence. Worse than that, it is looking at the whole past history of mankind with a blind eye. For humanity, human nature, man as we know him, is the creation of good will, teamwork, federation, yes, love. Mere struggle or hate or dissension never created anything. Moreover, society is not a set of pigeonholes or watertight compartments, but a cross web of infinitely fine strands of interest. Classes cut across classes, form, break down, and form again. The failure of general strikes illustrates how classes do not cohere. I can see no prospect for social reform through socialism unless socialists focus their efforts more and more consistently upon education in dynamic morality and in administrative ability. That is to say, the socialism of Wells and Sidney Webb holds more of promise than that of the Marxists.

Progressivism stood somewhat within the pale of such revisionist socialists as Bernstein, who admit reform measures while waiting for full community assumption of the means of production. Whether it is dead beyond resurrection as a separate political party or not, it has left already on contemporary thought an indelible protest against economic individualism of the militant type. Paradoxical as it sounds, President Wilson's New Individualism was genuinely socialistic, at least to the extent that it aimed to control big business in the interests of the smaller producer, by curbing not its social but its individualistic tendencies. It sought to general-

ize opportunity, not by *laissez faire* but by more effective social control. The war has temporarily at least committed the government to a much more rigorous régime of control. But should political leaders attempt to revive ante-bellum kid-glove methods of social control over industry they will probably fail and their failure will simply strengthen the socialist in his rejection of all mere temporizings with militant self-interest.

Finally, of philosophic individualism itself we may venture to conclude that it is simply the transition stage between the instinctive sociality of primitive men and the rational self-subordination of citizens of the City of God. That degree of social perception will mean, let us recognize frankly, the elimination of the social worker, because men will have ceased to exploit each other and will have been educated to spontaneous service. It will mean the passing of our clumsy organizations and institutions for human welfare. In their place—who knows—we may be able to establish,

“Without edifices or rules or any argument,
The Institution of the dear love of comrades.”

CHAPTER III

RECENT TENDENCIES IN SOCIAL REFORM

I

Plunged as we have been in the midst of wars and rumors of wars, where the very foundations of existing law and order, to say nothing of the whole great structure of what we have been calling the civilized world, seemed to be toppling, it may seem a vain hope to talk of social reform. Surely the appearances are against the prophet. But prophets were always the servants of lost causes. We may comfort ourselves with the hope that humanity has second wind, perhaps even tenth and hundredth winds. There is hope, too, in the fact that all of the straws are blowing in the direction of generally accepting the modern trend of social reform as distinctly good policy in terms of national strength. Hence, in spite of the fears of some social workers that the war is going to leave the whole world in such a state of moral and economic bankruptcy that it will be impossible to find a leader with liberal inclinations or a cent for financing schemes of social improvement, it is possible to believe that after the nightmare is over statesmen and business men and all good citizens will find that the surer and speediest road to reconstruction of social health and prosperity is along the paths being traced out by the more clear-sighted of those much abused friends of humanity called the progressives, the liberals, the reformers.

Professor Sumner used to reduce the whole business of social reform to terms something like this: A and B get together and decide what C shall do for D. And there is no denying that a lot of half-baked "uplift," particularly

of the sentimental or "tag-day" type, does fit Sumner's formula admirably. But the social reform to which I want to direct attention is of a somewhat different stripe. To be sure it is A and B getting together to do something for D. But its fundamental purpose is not to throw D perpetually upon the charity of C, but, so far as it is possible, to create a type of society in which D can look after himself. In other words, the dominant note in social reform to-day is not some petty messing about trying to give this particular D a little bit of medicine, that D a bit of good advice, and a million other D's bundle days or free soup and ten-cent lodging houses. It is trying to stop or at least to slow up the manufacture of D's. We may call this trend, perhaps, the *preventive phase of social policy*.

Now, of course, we must be reasonable. Social reformers are not trying to make the sun rise in the West nor to rule winter out of the year's calendar. They are trying to keep within range of the humanly possible. But right here we must remember that some of us have a larger dose of faith than other people. And some folks are able to see farther and more clearly than their neighbors. Consequently even the modest outline of what I conceive that people of social vision believe to-day may seem to the myopic Faint Hearts utter hallucination. But remember this, every accepted institution with all its show of immemorial solidity was once but a dream.

When one turns to the field of modern so-called good works, the charitable agencies, the societies for promoting legislation, the Pro-thises and the Anti-thats, he almost throws up his hands in despair at the prospect of attempting to get any clew to an orderly analysis of the welter. But a close study of those agencies and those social forces that are really counting for something in the noisy loom of modern welfare work brings into prominence at least three very clearly defined tendencies or lines of action.

II

The first of these hits one squarely between the eyes wherever he turns. It is the fact that we live in an age of more or less constructive criticism, based upon the beginning at least of scientific research. Gossip credits a United States senator with observing recently that politics is becoming more difficult every year. People formerly were contented with the torchlight procession, the band, and the campaign quartet; the speech was the merest incident; nobody was expected to pay any attention to it. "But now," he says, "things have changed, and I have to be careful what I say!" Constituencies are becoming somewhat more alert. Taking this tendency at its best, let us say that the preliminary to any really valid social reconstruction is critical discussion. I do not mean, obviously enough, mere venting of spite or venom; I do not mean incendiarism; I do not mean preaching of violent revolution; I do not mean the attitude that whatever is is wrong; nor that type of Messianic conceit which sees in itself the center and circumference of rightness. To one such a local wit recently voted a heraldic seal inscribed to So-and-So, Esquire, *ram্পant*, above the remainder of Minneapolis *dormant*! I mean the tendency to accept the principle that things change, and that the only way to transmute mere change into rational betterment is to get the facts, ponder over them, discuss them, and extract, if possible, some hint as to appropriate policy.

Such an attitude commits us clearly to accepting the three canons of profitable criticism. First, it must be sincere, not mere notoriety seeking nor general grouchiness nor emotional explosion. Next, it must be seasonable and timely. The crisis of war or other social cataclysms which require speedy and unhampered administrative activity must set aside temporarily some of the normal privileges of men, including the unlimited right

of discussion. President Wilson stated this principle very clearly in his letter to Max Eastman a few months after our entry into the war, by saying: "I think that a time of war must be regarded as wholly exceptional and that it is legitimate to regard things which would in ordinary circumstances be innocent as very dangerous to the public welfare." Here, of course, we strike bottom on the problem of "rights" analyzed in a preceding chapter. The third canon of criticism requires that it be constructive; that is, based on acquaintance with facts, probity, and a sense of perspective. Mark this, facts, like rights, are only relative, never absolute, and only take on meaning when arranged with reference to other facts. This is the snare of amateur statistics which must have prompted Mark Twain's advice to "get your facts first; then you can distort 'em as much as you please."

Granting these rules of the game, what is the proper attitude toward social criticism? The standpatter says, of course, that talk is cheap. Now talk *is* cheap, far cheaper than deputy sheriffs or Uhlans. Our remote ancestors were direct actionists; they bothered little about discussion. If things were not as they ought to be, the big club or the battle-ax was trotted out to break the cake of custom by the simple method of breaking heads. Nature seems to have foreseen this method of social reform by providing thicker skulls for our primitive forbears. But the whole trend of human history has been to substitute for force some form of more nearly rational persuasion. Slips occur, and parleying breaks down, but the principle remains.

To some minds it is hazardous to attempt to dissolve the cake of custom or the established order by such indirect methods. To such minds there is always something hauntingly dangerous in loosing the human tongue. Teachers still lose their jobs because they allow their students to analyze the institutions under which we live.

It is still risky to discuss the family or private property or the tariff or the antiquity of man or comparative religion. Such things are safe enough so long as they are kept as dead specimens in a museum. But to hint that they are live issues sends a thrill of horror up the spines of our Brother Fearfuls. Such minds prefer to step gingerly along Problem Street refusing to look either to the right or to the left, hoping and praying only that if the volcano of denunciation and revolution must break out it will at least be after they are safely out of harm's way.

But the more robust type of mind is not afraid to face things squarely, and to say that all is not well with the institution of the family, that the whole form and content of family life may change immensely for the better, that religion still wears the unclean rags of earlier materialism and superstition, that private property is not nearly so sacred as supreme courts have thought, that private business is not private property but public trust, that with all our American assurance we are provincial and at least a generation behind warring Europe in many of the essential arts of life. Mind you, the men and women who say such uncomplimentary things about our country, our times, our institutions, are not merely nor exclusively anarchists, nor socialists, nor squint-eyed radicals. They are the hundreds of thousands of students who pass through high school and college; they are the nearly four million members of the American Federation of Labor; they are captains of business like Mr. George W. Perkins who tells us that our thinking is so wrong and our business methods so bad that no peace between capital and labor is possible until we change our ways; or bankers like Mr. F. W. Vanderlip who accuses American business men of being socially shortsighted because they are illiterate in economics; they are you and I, sober thinking conservatives who daily challenge the world to answer for its wrongheadedness.

We are all critics; that is, all of us who are not mere

vegetables or cows. The desperately poor do not criticise. They simply feel miserable. Criticism, rational criticism in particular, requires courage and the energy that comes from sufficient food, clothing, shelter, leisure, and education. Perhaps the most valuable product of three centuries of the Renaissance and the Protestant Reformation, one century of free public schools, and fifty years of positive science and public libraries is just this ability to look about with a certain amount of critical judgment. I do not say that there is not a vast amount of mere carping and fault finding and misjudging—even the best of coal leaves some ash. But the point is that the test of social as well as individual life is the ability to see a problem and to solve it; and the ability to see a problem is fundamentally an exercise in critical judgment.

Big business men are being taught to meet this critical attitude with the arts of prestige. A well-known American publicity man addressing a group of railway officials declared that success in solving the railroad question rests upon the art of getting believed in, as Henry VIII and William Hohenzollern were able to get their people so to believe in them that their contented subjects were glad to have them do whatever they desired.

Running the gantlet of organized criticism is recognized as a serious matter, and rightly so. The method, says the publicity man, is to make the public believe it is contented. Contented cows do not criticise but give rich milk!

We are told to judge not lest we be judged. That simply means we are to know the facts. Judgment or the critical attitude does not mean condemnation. Know your community, know your city, survey, cast up your social balance sheet: these are the day's slogans. This is what I mean by the tendency to constructive criticism. Savages when asked why they do certain things simply say, "We have always done them so, our fathers before

us did likewise. Therefore what is right." The savage you see, is the arch standpatter. But the modern social reformer refuses membership in the old tribe. For him the best is yet to be. Hence he makes investigations, he prepares statistics, he studies wages, housing, industrial accident, child labor, and all the rest of it. He publishes reports. He founds journals like the *The Survey*, *The New Republic*, *The National Child Labor Bulletin*, *Housing Betterment*, *The American Labor Legislation Review*, and a dozen others. The government wakes up and adds its quota of ammunition to the discussion, with census reports, bulletins on wages, industrial hygiene, cost of living, infant welfare, child labor, homes for working folk. These are the multiple plows which are being driven daily through the friable soil of our minds, that same soil which but a few generations ago would have required dynamite to break it up for the sowing process.

Let meetings of protest multiply, then; let nothing be done to hinder the freest expression of the right to assemble and voice approval or grievance, of course within the three canons already laid down as to legitimate and profitable criticism; let the printing presses groan and the postman stagger with the multitude of pamphlets and journals of social discussion. If, for example, Comstockery and the police or the church attempt to suppress decent discussion of such a vital issue as birth control, we may be sure it will be indecently distorted in the press or elsewhere. Prudery invokes prosecutions against various sorts of well-meant inanity, but inanity persecuted assumes the cloak of wisdom. The crank is not going to be any less cranky if you bottle him up. Let him uncork ere he burst. Meanwhile the men and women of social vision will see to it that nothing is done in a corner, and upon the basis of the facts that they dig out of the corners and elsewhere, we may hope to have some hints of a better type of social structure.

This, then, is what I mean by the strong trend toward

constructive criticism as a method of social reform. And despite much vapidty and muckraking and so-called "raids on prosperity," the trend is unmistakably sound, valuable, and productive. If I were to summarize the value to social reform of this social criticism I should say that it lies in making our social policy the result of carefully thought-out convictions and not a hit-or-miss series of scared concessions to stave off revolt. Incidentally it waters the springs of that real democracy for which we went forth to battle.

III

The second unmistakable trend in modern social reform is the tendency toward collective control over all the conditions of community life. From the legal standpoint we might call this trend the rapid extension of the police power of the State. Clearly this cannot mean increasing the number of professional policemen, sheriffs, or militia. So far as I know there is no tendency to increase the negative side of police work. Clubs and handcuffs are even less in evidence than they were a generation ago. It is the increase of positive policing which is so pronounced. It is the use of policemen as sanitary inspectors or safety devices that we have to notice. For example, in New York policemen have been directed to protect socialist meetings from interference and disturbances instead of dispersing them by clubs and riding them down. And not long ago, they were used as investigators of unemployment. But police power means far more than policemen. The police power or "public polity power" of the State means the general-welfare function of the State. Our Constitution laid upon this government a century and a quarter ago the duty of promoting the general welfare. But government was somewhat slow in grasping the meaning of this duty. It was concerned chiefly with protecting us from foreign

danger and from violence or disruption from within. Its general attitude was to keep hands off until trouble actually threatened. But a distinct change of attitude is now observed. The sum of state duty is not now merely to avoid trouble but to "secure and promote the public welfare." The government is not the passive policeman, but the active welfare worker. It actually initiates good works instead of merely reviewing the acts of humanity's well-wishers. It does not wait until disputes arise between industrial factions, but now tends to assume collective control over the industrial conditions which breed disputes. In short, its function is more and more clearly preventive and constructive. Let me illustrate.

For the first century of our national life, public authority permitted an almost absolutely unrestricted exploitation of the country's natural resources in land, timber, water, minerals. It was the era of expansion and conquest of a rude, untamed, but marvelously rich wilderness. Incredible fortunes were amassed. But incidentally incredible wastefulness and improvidence grew before our eyes. At last the idea burst upon us that the principle of unlimited exploitation, of "after us the deluge," was unsound social policy, and the government interfered. Now comes the policy of national conservation of natural resources. Now the government sets aside national reserves of forest and mineral lands, assumes control over sources of natural water power, reclaims desert land or swamp, protects wild game, and the like. Community control over what is regarded as the community heritage is now definitely, though belatedly, accepted as a business principle. Not very long ago we read a statement from Judge Gary of the United States Steel Corporation to the effect that "It is rapidly dawning upon the clearest thinking of our citizens that there is still a higher kind of efficiency than that of competitive individualism; namely, the efficiency of properly devised and safeguarded coöperation." Notice, in

passing, that it is at least a half turn in a gradual revolution in the idea of private property. This is the positive side of it. Whatever else the great war may accomplish it is sure to emphasize this positive principle in the process of social reconstruction. The negative appears in the cumulative tendency to suppress things and trades considered harmful to health and efficiency or abhorrent to decency. Hence the nation-wide wave of prohibition, the Federal Food and Drugs Act, the Mann Act prohibiting the White Slave trade, and the pretty general move to suppress commercialized vice.

Another phase of the same tendency appears in the world-wide drift toward public ownership of the great public utilities—transportation, light, heat, power, minerals. Government ownership in Alaska and the municipal ownership of many utilities are salient examples. The wide range of these new forms of public ownership is disconcerting to the older generation. Many American cities now own their own lighting, heat, and water plants, telephones, street cars, street-paving plants, electrical supply stores, ice and cold-storage plants, ferries, theaters, abattoirs, markets, and coal yards beside their regular education, health, and recreational equipment. You notice I called the tendency a *drift*. By that I meant to say that whether it is a good tendency or a bad tendency it is too early to judge. But the tendency itself is undeniable. It may be that the people have not fully counted the costs. It may be that the wastes and the inefficiency will be great. But the drift has set in just the same. Wholesale interference of government in business in the European War has shown that the thing is possible and even immensely practicable even in such strongholds of individualism and suspicion of governmental initiative as England. And we may be sure that the lesson will not be lost to the American people. Indeed many great utility corporations are silently preparing for *der Tag*. Many of them will make no serious

protest; many will welcome public ownership as a relief from public regulation; some are actually abetting the move. This may be State Socialism, but whatever the name, it is with us; and we may be pretty sure that the movement will not stop with the utilities we have mentioned. Other basic utilities covering food, housing, leisure may easily follow. And all under the principle of positive police power in the service of public welfare.

Meanwhile, both the very momentum of the current itself and the examples of European countries borne in upon us by the stress of the war speed up the rate of public assumption of control. The Non-Partisan League of the upper Mississippi Valley openly demands not merely state but federal ownership of grain elevators and other marketing agencies. Massachusetts gravely votes on a constitutional amendment permitting cities and towns to buy and sell necessities of life for the benefit of their citizens. New Jersey acts somewhat similarly. In California the state market commission began to fix maximum prices of fruit, fish, and other products at least a year before the federal food administration got under way, and the courts by inference have sustained its exercise of power. The sixty-fourth Congress appropriated \$50,000,000 for a government controlled merchant marine, \$11,000,000, for a government armor-plate factory, and many more millions for good roads and land reclamation. It becomes increasingly apparent that the only water-power legislation which this country will tolerate must include rigorously guarded provisions for federal control and easy "recapture" of rights leased to private companies. The governments, both state and national, are waking up to a new concept of their duty in the field of housing, town planning, and small holdings of land. The federal Congress appropriated at least \$100,000,000 for housing munition workers. Massachusetts by constitutional amendment permits building, with public funds, homes for workers to be sold at cost.

The State of California is launching a small farms experiment of unusual interest. And in general it may be said that the courts are becoming more and more liberal in their recognition of community over individual rights in such matters as zoning, excess condemnation, or nuisances. Quite apart from the war, strong demands have been going up from conservative quarters for federal control or ownership or any other method by which the anthracite coal monopoly might be broken up. And we have moved so far toward federalizing the railroads that there is scant likelihood of our ever going back to the old and wasteful system of private exploitation. Whether telephones, cables, and telegraphs follow is merely a matter of expediency about which it is not easy to stir up much feverish emotion. More straws indicating the force and direction of the current will appear in a later chapter.

Take another illustration. The police power of the State provides the legal basis for labor legislation. All that mass of law and court decisions relating to wages, hours of labor, child labor, accident compensation and women's work which has been piling up recently relates back to the primary constitutional provision about public welfare. But you may ask, as many others have been asking, "Who is the public? Are labor unions, the unemployed, women and children *the* public? Isn't the owner of property or the employer also the public?" Quite so. But the point is, that our whole American political and social system is based upon industrial property right, as President Hadley shows. Our federal government and our Constitution are distinctly creations by and in behalf of a propertied class. Private property has been the guide to legislation and court decisions. Labor has been conceived of only in terms of its attitude to property. Indeed because laboring people have been looked upon as potentially equal to other property holders before the law, labor has usually been the defendant

in court actions. But recently an urgent attempt has been made to mark off the rights of the individual as against those of property. "Where the acquisition of property is measurably within the reach of all there can be no conflict between property rights and individual rights. But since the Civil War there has been developing in this country a larger and larger class to whom the acquisition of even a small amount of property is less and less possible. And at the same time there have appeared large accumulations of property in the hands of a small number of persons. Thus has arisen a conflict between property rights and individual rights." Thus writes Professor W. F. Dodd, one of America's ablest students of the constitutional aspects of social legislation.

About the facts there can no longer be any reasonable question. In the last twenty-five years, several authoritative studies have been made of the distribution of wealth and income in the United States. Spahr, Brooks, Hunter, Rubinow, and most recently Professor King have demonstrated the gross inequalities in the incidence of property and income. I suppose it is perfectly safe to say that two-thirds of our total population are wage workers not wholly without property, but at least inconsiderable from the standpoint of fixed capital; about one-fifth are farmers and the remaining one-seventh, capitalists, small traders, and members of the professional class. It is well within the truth to say that somewhat less than one-half of all our people are propertyless, at least from the standpoint that they do not possess enough to benefit either by the discipline of ownership or the social stability which property confers; nor are they insured against the vicissitudes of the industrial system.

It is for this reason that the disinherited, the propertyless, the weaker classes have become of such concern to the police power of the State, and this is why the interests of owners of large property as such must give way to the broader interests of society. "The individual,

whether with or without property, is the object of the new social and industrial legislation," says Dodd; not in the sense of some absolute individual, but in the sense of a vital part of an organic whole. It is apparent to such conservative thinkers as President Hadley that whether we like it or not the current is flowing toward the protection of the weaker and that there can be no permanent turning back. We are committed to a policy of protection, protection of our nation's human resources, for that, in short, is what the whole thing amounts to. That is why courts, notably the United States Supreme Court, are coming more and more to consider not narrow legal technicalities but broad social policies in labor decisions; that is why they no longer ask themselves, is some traditional theory of free contract contravened, but are the health, morality, and efficiency of workers at stake? For example, the courts gave respectful attention to the great briefs of Mr. Brandeis not because they referred to aged and respectable laws, but because they appealed to facts of psychology, of physiology, of economics, of sociology, of race welfare. And in general it may be held that the acceptance of these facts, the frank recognition of the inequality of bargaining power between employee and employer, is the point of departure for most labor legislation, notwithstanding the equally frank and clear perception that such an attitude and such legislation is undeniably and necessarily class legislation.

The Supreme Court gave this idea classic expression in its famous doctrine of "reasonable classification" as laid down in the case of *Holden v. Hardy* in 1898. Said the court: "It is by recognizing this inequality of bargaining power, coupled with a public purpose, that the courts pass over, in any particular case, from the theory of class legislation to the theory of reasonable classification. The two are identical in one respect; all classification is class legislation, but the kind of class legislation which the courts condemn is that which they consider

to be 'unreasonable' classification. Class legislation benefits or burdens one class against others where there is no real inequality or no public benefit. 'Reasonable' classification benefits or burdens a class where there is real inequality to be overcome and a public benefit to be attained. That which is class legislation at one time may become reasonable classification at a later time, if the court perceives that what it once thought was equality is really inequality, and what it once thought was merely private benefit is also public benefit."

This is why laws and court decisions multiply, fixing certain minimums of wages, hours of labor, and working conditions. There is, for example, a well-defined tendency to establish minimum wages by law. Primarily the laws apply to women, but there is no real reason why they should not be extended to men. Modern industry is so complex and cost-accounting systems so imperfect that it is all but impossible to give exact meaning to the phrase, "the product of one's own labor" as it could be given under the old handicraft system where a single worker turned out a complete article. Economic theory can fix certain limits, but within these there is a certain twilight zone in which law or bargaining or both must operate and decide. Otherwise, as Chief Justice White inferred in upholding the Adamson law in 1917, we should be reduced to a position of stalemate in which a void or rather a state of anarchy existed by virtue of the fact that private right had destroyed public right. Hence in terms of general social policy we might say that minimum wage reform is an attempt, not to subsidize the inefficient but to make up the "social deficit between wages and life."

It must be recognized, moreover, that a good deal of real wage legislation goes on under other names. I mean that there is even in the United States a notable tendency toward what might be called "national distribution" or indirect subventions to private income in the forms of

vocational education, recreation (playgrounds, bathing beaches, public baths, parks, community centers, etc.), insurance, pensions, to supplement industrial distribution in the form of wages. Not all these moves have so far demonstrated their unqualified right to be. The matter of old-age pensions, for example, is obviously a makeshift sort of measure, a confession that sickness, vocational unpreparedness, speeding up of industry, uncompensated accident, low wages, thriftlessness, and other untoward conditions have been allowed to produce a dependent and helpless old age. But on the whole we shall have to be prepared for a considerable extension of police power in these forms of public welfare. In this connection we might point out the strong trend toward public as against private relief work; or, if you prefer, the tendency to supplant private charity with public relief. The whirlwind of mothers' pension legislation and the extension of public supervision over private charities are clear illustrations.

Along the same line is the tendency to regulate hours of labor. Here organized labor itself has taken the lead and set as a general standard an eight-hour day. How far short of that ideal we have fallen is apparent to anybody living in any great industrial center where labor unions have been crushed, as in the Pittsburgh district, or where areas have been given over to big unregulated production in basic industries. It may be that the hours of men's labor have to be left to bargaining by strikes and the other arms of industrial conflict, or to the gradual penetration into the thick skulls of captains of industry that a ten-hour or twelve-hour day is, generally speaking, terribly wasteful both in the short run and the long run. Meanwhile, however, public control has extended itself over the hours of women and children, with night work prohibited. The average minimum child-labor age, taking the country as a whole, is approximately fourteen years. But there is a distinct tendency to con-

sider sixteen as the normal school period, and with the development of vocational education, to extend the period of half-time work three or four years longer by means of continuation schools. The legislatures and courts, under the guise of caring for posterity, have constituted women and children a favored class. Just as soon as they wake up officially to the fact that fathers are equally necessary to posterity we may rest assured that what is sauce for the goose will be recognized as sauce for the gander, and more definite protection will be given to men with regard to their working day.

Some legislation has recognized also the advisability of one day's rest in seven. And organized labor in general approves the idea, but refuses to go on record in favor of any one particular day of the seven.

One of the most remarkable and rapid extensions of police power has occurred within the last few years in the field of accident and sickness prevention, not only among factory or railway workers, but throughout the whole social body. Safety First, Play Safe, Be Careful, Walk Right, Don't Spit, Swat the Fly, Bat the Rat, and similar slogans greet us where'er we walk. And rightly so. All such efforts to conserve the lives and health of men, women and children, are based upon the sociological principle that we are all members one of another, that we are hopelessly bound together with bonds all but organic, that as one person or group is disabled all the rest must suffer sympathetically.

Another illustration. Public responsibility for unemployment is gradually being shouldered. The experiences of the winter of 1914 waked us up as never before to the necessity of organizing industry and in particular the labor market so as to avoid the tremendous losses in money, in character and in industrial efficiency through intermittent employment. Both the federal and some state governments are coming to a realization that the job is so immense that perhaps only the welfare power of

the State can handle it. Of course for a long time we have had at least in name public employment bureaus. But the less said about them the better. The recent tendency has been for the federal government to extend this bureau service, to relate reclamation and conservation projects and other forms of public works to periods of depression in ordinary industry. There is even talk of following European examples by introducing some form of unemployment insurance; Massachusetts is actually considering a bill for this purpose. Demobilization has aggravated the need for stabilizing employment and for forcing extensions of public service in this direction.

There is every prospect of certain extensions of the idea of public insurance against sickness and industrial disease. So far the American mind has resented the idea of compulsory insurance, and our constitutions, federal and state, as they now stand, back up this attitude of mind. But Wisconsin has already gone into the business of public life insurance; California and other States are writing industrial insurance; the federal government set a revolutionary pace with its military and naval insurance law of 1917; and the great private life-insurance companies are beginning to take heed of the competition and to mend their ways. They are much in the same position as the utility corporations and have had the same warning sounded in their ears. The growing concept that private property is a public trust may be expected to attain such strength that the law, the constitutions, and the courts will become more favorably disposed toward the idea of compulsory insurance for health. If I am compelled to give of my time and my money to keep my sidewalk clean or to send my children to school, why should I refuse to contribute for insurance, particularly when one of the surest results of that insurance policy will be to remove some of the conditions which threaten my health and the health of my fellow citizens? This argument is implicit in the insurance movement, and is almost cer-

tain to catch the public mind in time. If we could only devise some word less odious than compulsory, the way would be sure and quick. This is just as true of compulsory vocational education as of insurance. If we could do the business without the adjective, in one generation or sooner custom would accept the practice and we should feel the weight of insurance scarcely more than we feel the weight of the atmosphere.

In all of these extensions of public-welfare power must be recognized certain ideas somewhat disruptive to the nice old tidy arrangement of our governmental house. Somehow or other the kitchen threatens the sovereignty of the parlor or bedroom; and there is danger that the coachman may sometimes install himself as butler or cook. The old fetish of absolute separation of the powers of government is assailed, at least by implication. Both courts and legislatures are still somewhat jealous over relinquishing to administrative agencies the powers of legislation and judgment on matters of detail. But the tendency is undoubtedly to enlarge the scope of administrative activity. State Boards of Control exercise many judicial and rule-making powers in public charitable and correctional activities. They prescribe rules governing state institutions, adjudge disputes between counties on matters of responsibility for the poor, etc. Minimum Wage Boards and Industrial Welfare Commissions have been given authority to frame and prescribe minimum wages and detailed standards of working conditions, for example, in Wisconsin, Minnesota, and the three Pacific States. This means both a process of judgment, the determination of fact by accurate and reasonable investigative methods, and detailed legislation, the fixing of standards and rules based on those judicial findings, within the general legislation creating such boards or commissions. If at any future time the objections to this delegation of authority are renewed on constitutional grounds and are sustained by the United States Supreme Court it will

be possible still to forestall such objections by a definite constitutional amendment similar to that passed by California in 1914 expressly permitting it.

That this redistribution of governmental powers is inevitable appears in an explicit statement made by the highest court of Minnesota in the case of *State ex. rel. John F. Kelly v. Henry Wolfer*, involving the power of the Board of Control to transfer a prisoner from one penal institution to another. The court held that the newer concept of punishment as reformatory treatment "of necessity involves an extension of the administrative side of the penal system, and imperatively demands greater freedom and wider powers on the part of the executive and administrative officers. . . The changes in the conceptions of 'punishment' and of sentence for crime . . . necessarily require that the constitutional division of the government into three departments should receive, so far as the question here under consideration is concerned, a more liberal construction than might have been logically possible when this provision was inserted in the first American Constitution. . . Constitutions are not made for existing conditions, nor in the view that the state of society will not advance or improve, but for future emergencies and conditions, and their terms and provisions are constantly expanded and enlarged by construction to meet the advancing and improving affairs of men." Moreover, historically, it is perfectly possible to prove that the executive branch of government is usually the dynamic agent, and that if government contributes anything at all to social progress it is through wise and forward reaching administration.

Let me summarize here briefly the chief aspects of the trend toward collective control. They are, first, the tendency to substitute a sense of unnecessary waste and a desire to conserve social resources for the older attitude of condescending pity and the thrill of horror over the grim ways of an inscrutable Providence. Second, the

tendency toward public ownership of basic public utilities. Third, the tendency to magnify the interests of persons against those of property. Fourth, the fixing of minimum standards of wages, hours, health, and safety in industry. Fifth, public responsibility for insuring the education, health, life, and employment of all citizens. And all of these may be considered not as dangerous and illegal innovations, but as extensions of the fundamental and inherent police power of the State. Incidentally you can see the close bearing which these factors have upon the general problem of dependency and crime, particularly upon their reduction or elimination.

IV

The third path along which social reform has been moving comes as the necessary result of the extension of public control. It is the tendency to recognize the expert and real civil service in public administration. As President Hadley says, "Demand for state control of industry and for trained civil service must go hand in hand." One would not of course hazard a reputation for conservative statement by saying that we had attained already the desired goal of administrative honesty or efficiency in the public service. Governmental dry rot and political corruption are not yet quite stamped out. But remember I am speaking not of accomplished facts but of general tendencies. Hence I can safely say that there is a distinct move in the direction of better public administration. Americans are slowly giving up their inherited prejudice against the expert. They may still consider that they are the equal, politically and socially, of the expert, but they are willing in many instances to admit that he knows his special business better than they do. The success of such men as Goethals and Gorgas with the Panama Canal, the introduction of the City Manager into many American city governments, the

establishment of Bureaus of Municipal Research and of Legislative Reference, federal and state, have done much to fix in the public mind the desirability of turning expert work over to expert hands. President Wilson's war administration has stamped the principle with almost epoch-making authority. The American public will not soon nor easily forget that men like Hoover, Vanderlip, Davidson, Edison, Baruch, and Rosenwald left their business at the country's call and placed their expert ability at its service. The reaction upon standards of administration cannot fail to be enormously favorable.

Heretofore, American government has suffered far less from sheer dishonesty than from the general obsession that every American was a Jack-of-all-trades and consequently was fitted to turn his hand to anything from prison warden or labor commissioner to secretary of state or ambassador to the Court of St. James. Hence the tendency to extend governmental control over wider social areas, particularly as accelerated by the war, must carry with it an extension of means for training expert public servants in the problems of concrete administration, along with the demand for better means of checking up the honesty of public officials. Unless the ebb tide of war leaves a deposit of a leisured expert governing bureaucracy which refuses to return to its shops and its factories, men must be educated to fill their places. Such schemes, therefore, as the University Training Schools for Public Service proposed by certain American political scientists, economists and sociologists are welcomed as harbingers of a higher level of governmental efficiency. And the further fact that several universities have training schools for social and civic work, business administration, and consular service adds to our hope that government may become a real vocation.

It is at this point that the path of constructive criticism joins that of expert service. Sidney Webb, the great English Fabian, discovered long ago that mere

agitation for social change would accomplish little or nothing except the ultimate destruction of the agitator unless it were coupled up with definite training in administration. Hence the founding of the London School of Economic and Political Science and the entrance of many young liberals and socialists into government employ.

But, finally, the expert leader can do little without the support of an intelligent public, able at least to comprehend what the expert is driving at. That means at bottom trained, just, sound public opinion. How can we get it? We shall have in the long run to depend upon the public school. To be precise and perhaps a bit dogmatic we shall have to socialize more completely the public schools. I do not mean that we shall turn them into factories or shops, nor make them over into debating societies for the discussion of social problems. But we should organize them—teachers, students, curriculum—in such fashion that the product of the public school shall at least know how to recognize a social problem without being knocked on the head, and shall have some knowledge about how to form an intelligent opinion upon public affairs. We have made a beginning by introducing economic and sociological subjects into some high schools. But that is only a feeble and sporadic effort. We must extend the movement to include every high school. We need not stop with the bare adding of such subjects to the curriculum. Why should not every subject, whether mathematics or language or geography or history, be given a social orientation, both in content and method of instruction? And why wait till the high school, which so far is closed to nine-tenths of American youth? I stand squarely for introducing the child to social problems the minute he enters the receiving class in the elementary school. North Dakota has already worked out a sort of syllabus for this kind of teaching. What this frontier State has done every State and every school

must do if the paths which social vision has marked out as the paths of progress are actually to lead to a higher social level and not into the morass of futile palaver.

These three lines of tendency all represent, at their best, a distinct gain in the direction of putting public affairs upon a more nearly scientific basis. Criticism to become really constructive must ground itself upon the facts elicited by scientific investigation; and this seems to be what is actually happening as the result of new methods of social research and publicity. Social control and community welfare through exercise of the police power have been successful just in so far as they conformed to scientific fact on the one hand and took on the character of broad, flexible, scientific experiment on the other. They have failed in so far as they have played traitor to the scientific spirit and prostituted themselves to the doctrinaire. The tendency toward utilizing trained and expert service in community affairs is a triumph for the scientific spirit and the methods of science. It is perfectly clear, too, that if social workers are to be dependable partners in the approaching social reorganization which these lines of tendency plainly suggest they must not only equip themselves with some such philosophy as we have already sketched out, but must also catch the spirit and the outlook of science in every aspect of their craft. It behooves us, therefore, to examine more closely the strands of relationship between science and social work.

CHAPTER IV

THE SCIENTIFIC SPIRIT AND SOCIAL WORK

I

Science and the Scientific Spirit are big words. Because they are so pregnant and talismanic, they must be used with caution. Social work, likewise, has entered the popular vocabulary of key phrases, and apparently covers a multitude of both sins and virtues. Its very vagueness prompts the attempt to couple it with the concept, science, in the effort to determine whether it is a mere wraith or a good, sound structure of flesh and bone. Even the most superficial acquaintance with much of what passes for social work leaves one with such a taste in his mouth that he turns almost instinctively away and is ready to catch at any phrase which promises relief. "Science" promises such comfort and relief from loose thinking, looser talk, and the wasting of great reservoirs of valuable energy. It smacks of challenge and a trial of strength. In this chapter, borrowing an analogy from engineering, I propose to apply the concept of science and scientific method to test the "strength of materials" in what we commonly call social work. That it is worth while you may infer from the fact that the number of social workers, professional and amateur, has grown prodigiously in the last ten years, and continues to grow apace. New York City alone claims a force of four thousand paid social workers. London school authorities not long ago issued a call for seven thousand volunteer school and home visitors. The American Red Cross asks for several regiments of Home Service workers for its Civilian Relief department and

has developed institutes for training them in twenty-five centers. There are some twoscore of social workers' clubs, under various names, in the United States. All the broad-gauge colleges and universities, together with schools of philanthropy and social work, aim at turning out every year a new battalion of men and women devoted to social work. What constitutes social work and a social worker cannot then be turned aside as a mere academic question.

Social work as we know it to-day was born of a sense of responsibility to society. So ran the report of the Committee on Education for Social Work at a recent National Conference of Charities. But that statement does not bring us very far on the road to knowing what social work really is. Is it charity? Is it social reform? Is it professional doing good and earning one's living by it? Is it doing for other people what they cannot do for themselves? Is it "an effort to perfect social relationships"? If you applied for membership in a Social Workers' Club and gave any or all of these qualifications, would you be accepted? Nobody knows. At any rate, the definitions they imply are vague enough. If you turn, say to that great decennial encyclopedia, the United States Census, you will be plunged into even deeper darkness, for in it you will find social workers pigeonholed with such semiprofessional pursuits as abstractors, notaries, justices of the peace, fortune tellers, hypnotists, spiritualists, etc. (sic!), healers (except physicians and surgeons), officials of lodges, societies, etc., religious workers, keepers of penal institutions, theatrical owners, managers, and officials.

Of course, from the standpoint of ethics, social work is simply responding to the urge of that conscience which W. K. Clifford called "the voice of Man within us, commanding us to work for Man." And from the standpoint of sociological theory, all work is social because man is inexorably social to the core and must always work

for or with or against somebody else. He cannot work in a social vacuum. But all work is a sum of social pluses and minuses, when measured by its contribution to social welfare. Some kinds of work may yield us zero or even less. For example: a notorious thief of Milan once said to Lombroso, "I do not rob; I merely take from the rich their superfluities." And a brigand chief said to his judges: "God has sent us on the earth to punish the avaricious and the rich. We are a kind of divine scourge." It is evident that these men were doing social work, but rather of the negative sort and certainly beyond the pale of common social approval. Again, motherhood is fundamental social work, but many minuses enter into it; many children would better have remained unborn, for they become social liabilities in the shape of criminals and defectives. Scientific agriculture and invention in general are unquestionably forms of social work, in the sense that they contribute to the material basis upon which all social life on this planet must rest. But the invention may be turned to uses wholly destructive, hence may yield by-products fatal to human welfare. Dynamite may bore a railroad tunnel and blast the foundation pits for a temple or, dropped from a Zeppelin, rend in pieces innocent women and children. But what about giving Christmas baskets to the poor? Is that not nearer real social work? Take this case and see if you find any minuses: A family in a neighboring city received twelve baskets of food at the Christmas season. The Good Fellows or other well-wishers had done their work thoroughly. The head of the family threw up his job at once. About the first of the following February he went to the United Charities office and asked that the pleasant episode be repeated. This was social work, but it is an open question whether in such cases bombs are really much worse than baskets.

None of these examples of social work satisfy. None are illuminating or convincing. But I still believe there

is such a thing. It must, however, be stated in broader terms. And it can be. A bulletin of the New York School of Philanthropy defines social work as "any form of persistent and deliberate effort to improve living or working conditions in the community, or to relieve, diminish, or prevent distress, whether due to weakness of character or to pressure of external circumstances." We might go a step further or add a touch of literary varnish, and say that social work ought to stand for organizing scientifically the forces, personal and material of a community in such a way as to eliminate waste and friction, and to raise progressively the capacity of every member for productivity, service, and joy in life.

But, you may say, that is simply applied or practical sociology. That, to my way of thinking, is precisely what it is; and that is why "social work" and the "scientific spirit" must always be linked in theory and practice. Hence the field of social work is broad, but at the same time may be pretty definitely laid out for purposes of planting and cultivating special crops. The three chief crops I find to be, first, the spread of socialized intelligence; second, alleviative and remedial work on behalf of the subnormal or handicapped members of the community; third, organized prevention against adverse and depressive forces in the community.

This does not mean that for each of these crops we must have a separate type of "social worker." Indeed, the opposite ought to be true. Every juvenile court judge, or visiting nurse, or friendly visitor should combine the three functions of education, relief, and prevention. But for purposes of concentration and economy of effort, a division of labor may be necessary. Yet such a division ought to leave room for each type of worker to play into the other's hand. Those of us who are working to educate the public to its social duty and to bring about peaceful readjustments in social institutions, need the information which only the worker with the under dogs

can give. And the friend of the under dogs needs the breadth of view begotten of contact with the worker engaged in removing adverse conditions through preventive social legislation. And so on back and forth.

II

We may assume, then, with considerable assurance that social work not only is, but sets for itself a huge and intricate problem. Whether it is a fully fledged profession or only a profession in the making is of no importance to this present discussion. The real point is that *the scientific spirit is necessary to social work whether it is a real profession or only a go-between craft*. The cat is now out of the bag, but where has she jumped? No matter, but the mere opening of the bag starts a throng of questions. Chief of these I find in my own mind to be: why do people want to do social work, particularly if it is so hard and so comprehensive? Is it, perhaps, as the cynically minded claim, because of the "supply of the unfortunate to exercise their virtue on"? Or because they "conceive service as a kind of exploitation of mental inferiority, and so find a moral satisfaction in the thought of the intellectual poor whom they will have with them alway"? Are we absolutely sure that this is cynicism, or may it not be genuine moral probing? Perhaps, however, I had better put the question this way: How can you get people to do social work?

Back of all true social work must stand the impulse to serve. But whence is it to come? It is natural, you say. I grant that some psychologists claim we all have an instinct for seeing others well off. That was what Clifford meant by "the voice of Man within us, commanding us to work for Man." But unfortunately there are other voices within us commanding us to steal from, and lie to, and exploit, and otherwise abuse our fellow men. Our instincts never run along a smooth, even road in one di-

rection. They cut across and jostle each other fiercely. Instinct can never be swallowed raw as an explanation of noble or even fairly decent human conduct. It must always be liberally salted with discipline and education before taking.

Experience and training have shown men that some form of mutual service contributes to social and personal well-being. The original instinct to serve, however, had to be brought out through a long process of holding the lid down on other rival instincts. Mere instinct and emotion are blind and unsafe guides to conduct. That is why so many of us land in the ditch with our benevolent schemes. That is why I am so suspicious of appeals to act on impulse. That is why I deplore such sentimental calls as appeared in the press on February 29, 1916. We were urged by the president of a group of benevolent women to gain a day. How? In her own words: "A chance will come to every one to do something charitable that day. Let us do as our first impulse tells us. For once let's not consult what we call our 'better judgment' nor use 'scientific charity' in what we do for others. Let's do more sunshine and less charity." Such talk is simply the call to "go on the loose." It is precisely the same psychological path that impels men to get drunk or to fly at each others' throats in war. Civilization is the result of the illuminated and disciplined will. There is no unerring instinct to do good. To depend upon mere feeling or impulse is to revert to nature, to eighteenth-century mythology, Rousseau, and the cult of the "happy savage."

But if the impulse to serve is not instinctive, shall we say it must be religious? Is it not the dynamic side of faith? Recall that famous chapter on the nature and fruits of faith in the Epistle to the Hebrews. Abel and Abraham and Moses, Joseph, David, the prophets and many another worthy "who through faith subdued kingdoms, wrought righteousness, obtained promises, stopped

the mouths of lions, quenched the violence of fire, escaped the edge of the sword, out of weakness were made strong, waxed valiant in fight, turned to flight the armies of the aliens," were impelled to service through religious fervor. But like many other social workers they seem to have failed of their full reward—if we may judge from the somewhat cynical comment of the narrator of their trials. The religious motive has always been one of the strong forces back of the impulse to social amelioration. Hebrew and Chinese and Hindu sacred texts teach it. Christianity fostered certain types of charity. The calendar of Christian saints is redolent with them. Not a little of the best in so-called organized philanthropy (both spirit and methods) is traceable to the work of St. Vincent de Paul. The preaching of such men as Channing in New England during the thirties and forties of the last century fed the new tide of humanitarianism which brought us broader and more decent care of the afflicted, particularly the defectives and law breakers.

But neither instinct nor religion is sufficient; neither confers capacity, necessarily. Vincent de Paul's great work may be said to have begun by recognition of this principle. You remember his first case: a benevolent lady had asked him to recommend to his parishioners a certain needy family. He did so at the morning service. In the afternoon he visited the family himself only to find them already almost overwhelmed with gifts of food and money. "Behold noble but ill-regulated charity," said the saint, and set to work at once to make the benevolent impulse effective through vision and organization. That was the scientific spirit. Again, Channing's preaching was not the only spring that started Dorothea Dix upon her marvelous crusade on behalf of the insane in our country. For years, notable doctors had been importing the ideas of Pinel from France and Tuke from England. And for three years Miss Dix studied these new, scientific methods of treatment for the mentally de-

fective. It was this new, precise knowledge that gave some solid backing to her fervid moral enthusiasm. Her science guided her religion and made it efficient. Indeed, I am not sure but that it was science that drove her to the work and religion which served as ally.

At any rate, science does create the will to serve. The new knowledge of heredity has stimulated a whole tribe of eugenists, however mistaken they may prove to be. The more scientific the art of healing becomes, the more it becomes permeated with a sense of community duty and service. The newer developments of economic science and sociology have impelled us toward conservation of natural and human resources, labor legislation, health and sanitary work, protection of children, control of industry for social ends. Science yields place to no other source of enthusiasm for social amelioration. And science has *her* heroes. It would be easy to write the litany of scientific martyrs—Priestly, Lyell, Tyndall, Darwin, Huxley, Reed, Laveran, Manson, Ross, Lazear, Carroll, and a hundred others, who were stoned and sawn asunder, were tempted, destitute, afflicted, tormented, slain, like their brethren of religious faith.

But the glory of science is that to enthusiasm it adds a new quality. Let me illustrate: The impulse to serve, I said, must be present; otherwise there is no motive power. But the impulse alone is not enough. Volunteers by the million would never make an army. An army of raw recruits is actually worse than no army—it is in the way; it has to be transported, it clogs the service; it has to be fed, and takes food from abler mouths; it gets in the way of trained men; its own fears may stampede the regulars into rout and confusion. Only training—exacting, rigorous training—can make over the mob of recruits from a liability into an asset. That training is military science. Likewise, the hundreds of volunteers responding to the call to enlist in the social-service army against needless want and misery must be trained lest they re-

main mere cumberers of the ground. That is what I mean by the application of the scientific spirit to social work. The new quality which science adds to the impulse to serve is ordered intelligence, the discipline of knowledge. "If science does not produce love it is insufficient," wrote Amiel. I believe it not only enlarges the area of man's sympathy—that is, his love—but makes it effective. "Scientific" is not the logical opposite of "loving" or "warm" or "hearty" or "brotherly"; the real antipode of these qualities is *mechanical routine*.

III

Perhaps we should pause to run down to its lair the fearful word, science, and say exactly what we mean by the scientific spirit. Huxley said, "Science is nothing but trained and organized common sense." Isn't that a good deal? A trained and organized mind in contrast with a mental scrap bag; a disciplined army as against a motley, rambling mob. Science in the most generally accepted sense, like humor, is the detection of relationships; it is the relating of cause to effect. This means two things: first, that the scientific mind is always full of problems; it never takes things for granted; it never contents itself with fatalistically and complacently accepting effects. This means, it is evident, in the second place, that everything is caused by something else. Shakespeare makes Pisanio in "Cymbeline" say that "fortune brings in some boats that are not steered." Science denies that absolutely and irrevocably, if the lack of steering implies that ships just wander into port moved by no forces but chance. The spirit of science was nobly expressed by Matthew Arnold in the couplet:

"Yet they, believe me, who await
No gifts from Chance have conquered Fate."

The main business of science is to rid the world of chance and luck. Our forefathers charged their sickness and pov-

erty and pain to bad luck, hostile ghosts, an angry god, or a fickle goddess. Take down your Shakespeare Concordance and see how many hundred times his creations talk of fortune, luck, chance. Listen to the uncomplimentary, even vile names they call her—crooked, blind, skittish, a foe, a strumpet, and worse. Remember that all primitive philosophy, politics, and religion are based in no slight degree upon luck and magical devices for controlling it. Even now men persist in the same unflattering concept of Providence by inserting in their contracts exemptions from responsibility in certain business contingencies involving what they are pleased to call “acts of God.” Earthquakes and fierce tempests at sea are acts of God. Poverty is one of the mysterious ways in which Providence works his wonders to perform. Pestilence is a divine scourge. War, God judging the nations. Now, modern science is vastly too respectful, too devout, too well informed to perpetuate such childish attempts to connect effect and cause. Therefore in ridding the world of chance, it works in two ways—critical and constructive. Huxley has phrased both these aspects in his letters. In one he says, “Among public benefactors, we reckon him who explodes an old error as next in rank to him who discovers new truth.” On the constructive side he writes, “To be accurate in observation and clear in description is the first step towards good scientific work.” In sum, the work of science is to get at truth; not only at facts, but at the vital relationships between facts.

Science does not claim to have complete knowledge of the truth or to have established perfect order out of chaos in this world. It is less an accomplished fact than an attitude. Professor Sumner suggests this in his definition of science as “knowledge of reality acquired by methods which are established in the confidence of men whose occupation it is to investigate truth.” Hence, in connecting science with social work, our aim is not so much immediate results as an attitude of mind; for, as Huxley

pointed out, "The scientific spirit is of more value than its products, and irrationally held truths may be more harmful than reasoned errors." This does not mean, of course, that the scientist does not strive to know the greatest possible amount of truth. He is no mere dabbler or dilettante. Scientific truth is a serious business and cannot be achieved as you order goldfish or libraries or art galleries. You may buy a college degree or the God-bless-you's of a poor family, but you cannot buy the scientific attitude. Science, like the wisdom of Solomon, is above rubies and eludes all but the resolute, serious hearts.

Carlyle, in spite of his frequent wrongheadedness, was one of the best friends to social work raised up in the last century; not by the institutions he founded or the technique of family rehabilitation he worked out, but by his unflinching determination to see through the social shams of his time and to purge our systems, and his own, of cant or driveling. Such an acid test transforms mere vague opinion into dynamic opinion. It makes for the scientific spirit by refusing absolutely to allow any institution or idea or practice to take refuge behind somebody's mere say-so or to be frightened by the cry that it is old or sacred or in the nature of things and therefore not to be molested by mere man.

The scientific spirit refuses to call a hope or a longing a proved fact, no matter how urgent that longing or that hope may be. I may long to see parole work done with a hundred per cent efficiency; but that does not justify me in publishing that ninety-five per cent of my paroled men "make good" after leaving the prison gate. Much as I might have wished for a better showing, I was never able as a probation officer to claim more than one-half or two-thirds of my cases as successful. I may abhor the sight of painted women selling their bodies on the streets, but that does not justify me in saying that mere repressive legisla-
tion or policemen will wipe out prostitution. Science bases

its hopes on facts. It refuses to rest its case on the leadings of mere temperament. Huxley said, "Science seems to me to teach in the highest and strongest manner the great truth which is embodied in the Christian conception of entire surrender to the will of God. Sit down before fact as a little child, be prepared to give up every preconceived notion, follow humbly wherever and to whatever abysses nature leads, or you shall learn nothing. . . . My business is to teach my aspirations to conform themselves to fact, not to try and make facts harmonize with my aspirations."

There are several other concrete marks of the scientific spirit which should be considered. It is broad, tolerant, earnest, imaginative, enthusiastic, but poised and self-controlled. It is not impatient of contradiction and criticism given honestly and sincerely. It is fearless, truthful, teachable. It is able to withstand mob mind, sentimentality, sensationalism, and petty partisanship. It does not deny that a thing exists merely because it is not easily seen; but it refuses to fudge intelligence and the moral nature by claiming to see something before it really is seen. It also declines to think "the difficulties of disproving a thing as good as direct evidence in its favor."

Finally, the scientific spirit means generosity, fellowship, and hearty coöperation untainted by jealousy. Witness, for example, the cordial feeling between Darwin and A. R. Wallace. Wallace always spoke of the "Darwinian theory" although, since he was the codiscoverer of natural selection, it might with equal justice have been called the "Darwin-Wallace theory" or the "Wallace theory." Likewise Darwin, with fine generosity, recognizing that Wallace's splendid contributions to natural science brought him little financial return, set in motion a plan for securing a Civil List pension for Wallace, who was at the time nearly sixty. Huxley was equally generous and enthusiastic. He lent his heartiest support and

was able a few weeks later to hurrah over the success of the plan. A similar bit of generosity occurs in Huxley's undertaking the task of writing a chapter on the work of his old opponent, Sir Richard Owen, for the latter's biography. As a final instance let me cite the generosity of eighteen of Huxley's scientific friends who in 1873 placed £2,100 in the bank and informed him that he was forthwith to take a vacation for his health.

It is this fine spirit of coöperation, according to H. G. Wells, that has made modern science. "The whole difference of modern scientific research from that of the Middle Ages," he says, "the secret of its immense successes, lies in its collective character, in the fact that every fruitful experiment is published, every new discovery of relationship explained. In a sense, scientific research is a triumph over natural instinct, over that mean instinct that makes men secretive, that makes a man keep knowledge to himself, and use it slyly to his own advantage. The training of a scientific man is a training in what an illiterate lout would despise as a weakness, it is a training in blabbing, in blurting things out, in telling just as plainly as possible and as soon as possible what it is he has found. To 'keep shut' and bright-eyed and to score advantages, that is the wisdom of the common stuff of humanity yet. To science it is a crime. The noble practice of that noble profession, medicine, for example, is to condemn as a quack and a rascal every man who uses secret remedies." And the same spirit must animate social workers if they are to make their work truly scientific and really professional.

Most professions, whether law, medicine, preaching, or teaching, begin with the assumption that all a man needs is knack, luck, nerve, and persistent industry. Their professional aims are at first usually personal success and social prestige. But as they become permeated with the scientific spirit they rise out of mere crafts, and change both their aims and their methods.

The community spirit and a professional code are both cause and effect of their improved technique. Social work has been going through just these throes of development. Hence it is almost superfluous to ask why social work should take on the character of science. It is hardly a question of may or may not. Rather, should we say, it is a matter of the categorical *must*.

Is it shocking to declare that one must do good according to scientific rule? The highest praise accorded to Jesus of Nazareth is that he went about doing good. Do I believe he did it "scientifically"? I do, most emphatically. For the good is always relative, and to choose between the good and the best demands an illuminated and disciplined intelligence. A very considerable section of Christendom to-day believes that Jesus was the most scientific person that ever trod this globe. Science made his good work discriminative. Since so many people in the world still seem to fail of understanding either the spirit of Christianity or the spirit of science it may not prove amiss to elaborate this point. An unknown correspondent has taken me to task for venturing to couple Jesus with scientific thought. She writes:

" . . . I am studying sociology and am convinced that it is an indispensable subject to one who would work effectively for the advancement of civilization. I find myself so puzzled by your statements concerning Jesus that I am impelled to ask for enlightenment. I class myself with the not unintelligent middle class to use a phrase from the *New Republic*; I can follow Lester F. Ward, Franklin Giddings, Albion Small, et al., but find myself unable to reconcile the acceptance of Jesus as a historical character with the scientific attitude. Science refutes His divinity and history fails to establish the claim to His existence. Therefore, your introduction of Jesus into an essay advocating the scientific spirit is either evidence of the insufficiency of your scientific knowledge or of the insincerity of your presentation of that knowledge. I do

not wish to seem harsh, but those who aspire to teach must cheerfully welcome criticism, that they may orient themselves before they act as a compass to less favored members of society."

Since this letter is not only manifestly sincere, but also rather typical of a considerable body of dissident thought it demands a respectful hearing.

In the first place let it be said that the scientific spirit does "cheerfully welcome criticism." A modern sociologist insists that the spirit and method of science is such that no idea is held as sacred. Science, said Huxley, must not be impatient of criticism. "'Authorities,' 'disciples,' and 'schools' are the curse of science; and do more to interfere with the work of the scientific spirit than all its enemies." Darwin not only courted the discovery of contrary instances to his favorite generalizations, but even made a practice of writing down any exceptions he noted or could think of lest they be forgotten. Huxley credits Carlyle with having stimulated the scientific attitude by insisting upon sincerity, probity, making things clear, and getting rid of cant and shams of all sorts.

Now, then, is there any contradiction of this attitude in suggesting that Jesus worked scientifically? Let us remember first of all that science is not a mass of facts but an organization of perceived relationships between them. It is an outlook, an attitude of mind, a method of confronting the universe and wringing truth out of it. Moreover, it is a pyramid resting not upon a base of unshakable fact but upon an apex of metaphysical assumption. It is a method of transforming mere guess or flabby opinion into dynamic understanding.

Waiving for the moment any question of the historicity of Jesus or the authenticity of the Christian narrative, let us apply these tests to Jesus' work as described in the gospels. If he accomplished the works credited to him or spoke the words ascribed to him he satisfies the tests.

For in the first place he emphasized getting at truth—the truth that sets free. Next, he used the scientific method of demonstration by successful experiment. He verified his fundamental assumption that this is a spiritual world by inductive methods. Thus he passes the test of scientific consistency by living and demonstrating his theory. Again he did his work openly; there was nothing of the dark-room charlatan about his methods. He would be more at home in a laboratory or public clinic than with the astrologers or alchemists. His science was enlarging and expansive, not the pseudo-science which Wordsworth satirized as demanding

“That we should pry far off yet be unraised;
That we should pore, and dwindle as we pore.
Viewing all objects unremittingly
In disconnection dead and spiritless;
And still dividing, and dividing still,
Break down all grandeur, still unsatisfied
With the perverse attempt while littleness
May yet become more little; waging thus
An impious warfare with the very life
Of our own souls!”

Finally, Jesus showed the true scientific spirit by sharing his knowledge and his methods. He taught his disciples how to heal and otherwise demonstrate his theories of life. He told them they should do even greater works than he had done. His followers apparently kept up the work of spiritual healing for three hundred years. It is perhaps superfluous to add that he paid the familiar penalty which many another scientist has suffered for his faith. Socrates, Jesus, Giordano Bruno are all members of the same great scientific brotherhood, having passed through the same grim portal of martyrdom. And no more in the one case than in the other does the question of “divinity” figure. That is a problem of theology without the slightest relevance to this question of scientific attitude.

Now we come to the problem of the historicity of Jesus, or if you prefer, to the authenticity of the Christian tradition. But does it make any difference in this issue whether any such person called Jesus ever lived or not? If Professor Drews or Mr. J. M. Robertson succeed in demonstrating that Christ is simply a myth-complex, a generic name for a cycle of Hellenic and Oriental legends, or if the gospel narrative be set aside as unhistorical and inaccurate, the record itself, simply as a human document, remains unimpeached. For if not Jesus, nor Matthew, nor John, nor any of the individuals supposedly concerned, then somebody else manifested the spirit and maintained the attitude described in the New Testament story. It is the characteristic attitude and not the particular personality which concerns us primarily. For is it not possible to reckon and reckon profoundly with the influence of even a legendary character like Hercules or Homer or Socrates or Barbarossa? Nobody knows whether one single blind Homer or a hundred wandering Greek poets wrote the "Iliad" and the "Odyssey." But nevertheless we talk of Homer's use of the epithet, of his wonderful powers of compact description, of his sense of movement and color; and his heroes become educational and ethical models. We know of the life and death of Socrates largely through the dramatic dialogues of Plato; yet his character has stood out as the inspiration to generations of souls struggling with the problems of truth, justice, and immortality. Was he a man or only a dramatic character invented by Plato? No difference. Likewise with William Langland, the traditional author of "Piers Plowman." Professor Manley considers that this is not a personal but a dramatic name covering several fourteenth-century writers; but whether or not there was such a person as William Langland has absolutely nothing to do now at this range of five centuries with the effect of "Piers Plowman" as the fountain source of a great stream of social protest in English literature. And

as we look back to Jack Cade and his revolution we may be pretty sure that it was inspired by the vision of Piers and not necessarily by the visionary poet or poets. And who wrote Shakespeare? Was it Bacon or Roger Manners, fifth Count of Rutland, or a group of winebibbing actors or one William Shakespeare of Avon himself. Quite evidently in Shakespeare's own words "the play's the thing" and Olivia or Portia, Lear or Macbeth, Dogberry, Bassanio, Hamlet, Romeo, and Brutus are just the same wonderful and stimulating creations regardless of their literary paternity. These plays, like unsigned Grecian statues, stand by their own majesty and need no petty personalities as their credentials. To add one more example, Whately, I believe, proved once that Napoleon never lived; yet who doubts the effect of the Napoleonic tradition?

No, if the New Testament be nothing but a tissue of fairy tales and Jesus but a fairy prince, the story is not a whit less instructive to the scientist. The pity of it all is that a Christendom pretending to believe the story has carefully selected out the least credible or important parts of it and has made them the corner stones of faith while rejecting the really scientific elements which were its core.

Finally, there are certain aspects of Jesus' teaching which are basic to a wholesome concept of social work, and which may be called scientific without abusing the term. His concept of God as love and of all worship or service as love is the key to any sound process of social amelioration. His vision of social justice as laid down in the Golden Rule and the Sermon on the Mount is the greatest Magna Charta of human rights and liberties ever formulated. In his doctrine of the vine and its branches he lays down not only a plan for church organization—the church universal, the communion of the saints, the City of God, the Mystic Body—but he fore-casts a leading concept of modern sociological theory;

namely, that human society is an organic unity, if not of the biological, then of the psychological order. And, mark this, that organic unity as Jesus saw it seems to overleap every barrier of geography or race and to anticipate what we begin to call the international mind.

If, as I believe is the case, religion and science are not absolute opposites but are complementary, mutual correctives, then Jesus rendered science and social work a magnificent service by two contributions. First, his consistency, living and demonstrating the theory of God as ever-present and all powerful. Second, his idealism: an absolute idealism which conceived God as all in all, a power that makes not only for righteousness but also for health, peace, and the life more abundant. It was this indomitable optimism which sustained him and which preserves and energizes the modern social worker whether he be churchd or unchurchd, Christian or non-Christian, or name any name prescribed in the codes whereby man must be saved.

IV

Now turning back into the main highway of our argument, if you demand a concrete and explicit answer to the question, Why should social work be done in the scientific spirit? I should say, for two reasons. It is a dangerous, if not to say extra-hazardous, trade, from the standpoint of the worker himself; and it is a delicate and even perilous adventure from the standpoint of those whom social workers would serve.

Anybody who has ever tried to befriend the poor, the sick, the broken in spirit, the down-and out, knows the tremendous strain on body and nerves. The constant tugging at one's sympathies, the recoil of disgust at the sight of filth, disease, and broken character, the lurking possibility of contagion, the discouragement over failure after faithful ministration—all these wear down the fine edge of one's good will. It is easy to get the scolding

habit, to develop a spirit of moral peevishness, to assume the rôle of apostle, to exaggerate one's own sense of amiable virtues by constant contrast with the lives of those whom we may suppose to have wasted income and opportunity. The persistent giving of good advice is subtly degenerative to one's moral nature. Good people must beware of misinterpreting the maxim about man's extremity being God's opportunity. Man's extremity never means the doctor's or the preacher's or the social worker's opportunity for bossing and humiliating. On the other hand, if one escapes the Scylla of nagging, it is easy to fall into the Charybdis of complacency; then you have a sentimental Good Fellow, masculine gender; Lady Bountiful, feminine gender. If I were a "case" being "friendly visited" I should prefer the scold. And the danger to sound social policy is greater from the Good Fellow, for he means, enter the patron, exit the real neighbor and good citizen.

The scientific spirit does away with obtrusive personality; it pours a healthy astringent upon one's ego. It broadens our sense of personality until we get the idea firmly fixed that we are merely representing the best thought of the community and are not exploiting our own vanity upon the poor and needy. This is a very subtle temptation and can only be met by rigorous scientific self-immolation. Another hazard grows out of nervous strain and the air of patronage: this is the tendency to measure one's courtesy and good manners by social ranks. Discourtesy is no longer a good business asset. Even railroad ticket agents before the war were being trained to say, Thank you. But in the older relief type of charity a certain kind of waspishness and thinly veiled contempt still survives in places. I have never forgiven a prominent Boston charity worker for snapping her fingers in the face of an applicant for aid in San Francisco during those strenuous rehabilitation days after the disaster of 1906. I do not know whether the man's case was worthy

or not; but I do know that no real scientist would so forget the common decencies. I have before me a post card written to a poor woman by the milk and ice association of an Eastern city. It disdains all friendly salutation and reads simply: "If you do not report at regular Mothers Meeting Friday or Saturday, July 23, or 24, at 10 a. m. at Blank Building your milk will be stopped." It ends likewise abruptly without even the dry courtesies of a business letter. Does social service mean such forgetting of ordinary manners? St. Francis of Assisi, patron of relief workers, saw the value of courtesy. "Know, beloved Brother," he once said, "that courtesy is one of the essential qualities of God, Who maketh His sun to shine and His rain to fall upon the just and upon the unjust, through Courtesy; and Courtesy, is also the sister of Charity, which puts out Hatred and preserves Love alive."

As an antidote to the personal dangers of social work, and as a rough statement of the scientific attitude, I might add a sentence from the veteran head of the New York School of Philanthropy: "What charitable visitors need more than money in their purse is faith in their poor, humility of spirit, jolly comradeship, sheer psychic power to carry conviction for the right and sensible action against every argument springing from discouragement or bitterness or suspicion; from ignorance or stubbornness or weakness; even against such plausible arguments as arise from the very virtues and sound instincts of the poor."

Charitable relief of all sorts is a difficult and delicate job whether you consider the recipient or the community at large. Mediæval charity often bred beggars. Cash donations from either private or public funds may induce chronic pauperism. Personal service may easily cause a poor family to lose its self-respect and to "get limber." Private charities have been known to compete for the care of families, not for the sake of the families, but to

enhance their own prestige. Private charity sometimes pulls against public agencies, and vice versa. During the winter of 1914 certain families in Pittsburgh were aided by several settlements, benevolent individuals, and private charity societies; none of these agencies knew that others were interested; each thought it was in control. Finally, to complete the mess, the policeman of the district went about from house to house "to ascertain the needs" preparatory to a raid on the city treasury. To make confusion worse confounded, the city was suddenly caught in the throes of a "bundle day." One poor woman left a job bringing her in two dollars a day and stood for three bitterly cold days in a line at the bundle warehouse. When she finally got inside, all she could find was a bundle of old clothes worth at most fifty cents. Such charity is not only unscientific, it is criminal. So is the charity that makes each family or case the vested interest of a benevolent individual or society. So is the system of township relief as it used to be administered in New England, where whole towns were pauperized and corrupted. Illustrations might be multiplied *ad nauseam*.

But how can the scientific spirit in charity lessen its hazards? Chiefly by developing the rigorous determination to see clearly. That means thinking through each problem. The first distinctive test of a scientific worker is his ability to see and formulate a problem clearly. This is diagnosis equally in medicine, in law, in education, and in social work. It is hunting out cause and effect in all their ramifications, whether the problem be restoring a family to economic independence or writing social insurance laws on the statute books. It is refusing to be bluffed by what "everybody believes." Remember that "everybody" used to believe in witches, in possession by devils as the cause of insanity and epilepsy; "the best people" until recently believed that drink caused ninety per cent of all poverty and crime, and that un-

employment was a matter of downright personal laziness. Many people still believe that eighteenth-century English workpeople were debased wholly by the English system of public relief; they forget all the other forces contributing to that degeneration. Many good charity workers also still profess to believe, because Mayor Seth Low and his associates abolished public outdoor relief in Brooklyn in 1888, that public relief is necessarily corrupting. The average person still believes that because United States military pensions have been grotesquely extravagant, all other forms of public insurance or pensions are necessarily vicious. For the most part these opinions are simply swallowed. But no real scientist swallows without examination; he maintains the critical judgment and the open mind.

To see a social problem clearly means also to get away from mere impressions. It is astonishing how many of our decisions are made upon mere chance impressions. Love at first sight is matched by condemning a criminal because of the "look out of his eyes." The man in the street gives a quarter to a beggar if he "likes his looks." The family that can assume an air of broken gentility scores high in favor at the charity office. The crook that looks like a gentleman may get off on probation. The devout and compliant convict used to hookwink pardon and parole boards. There is in all this an element of beneficent charlatanry, charitable palmistry, or phrenology. It is utterly unscientific, just as unscientific as the reason an Industrial Worker of the World gave me recently for his belief that unemployment is increasing. He insisted that he knew it by personal experience and by the lengthened bread lines in an Eastern city. It is the same spirit that makes the optimistic poet sing of God in his heaven and well-being on earth when he feels well, or that drives the pessimist with bad digestion to call this the rottenest of all rotten worlds. The "general feel of things" is not a sound guide to either social theory or practice. I grant

that it is difficult to get beneath mere impressions; it takes time and persistence. We did not need Goethe to tell us that doing is easy but thinking hard—that is, real thinking, thinking through a problem to some sound conclusion and not mere daydreaming. But such thinking is the price of scientific work which will do more good than harm.

The final question is how and where to get this scientific training. Science is both an attitude and a technique. The attitude, which I analyzed earlier, can be cultivated without teachers, books, or colleges. The technique, particularly social technique, may be had from the literature of economics, political science and sociology in their applied aspects. You may go to college or to a school of philanthropy; you may imbibe methods from a trained social worker in your community. But remember that the technique of science is never fixed. Science always moves on. The charitable methods of twenty years ago may be utterly obsolete now. Our methods, even the most scientific, may be the laughingstock of our descendants in the twenty-first century. Social work may become a profession, if by that we mean that in addition to having an ideal of promoting social welfare, social workers become really qualified to do their work as no other profession can. It will become truly scientific only when every social worker sets as his ideal not drawing his meed of praise or money for turning off the day's work with as little friction as possible, but knowing the truth as it is and adding to the sum of truth for the creation of a world more worth living in and working for. To work for the truth that shall make you free—that is the scientific spirit.

CHAPTER V

SENTIMENTALITY AND SOCIAL REFORM

Up to this point I hope it is perfectly clear that social work to be scientific must express organized intelligence and good will to men. But in arguing thus for illuminated sympathy as an indispensable mark of the genuine scientific spirit one must not be misunderstood as capitulating to the apostles of "softness." The sword of the scientific spirit is good steel, forged in the warmth of human emotions but tempered in the cooling waters of hard thinking. We must now get hold of some of the elementary rules of that tempering process.

┐ The tragedies of leadership in social reform and social work result in the main from failure to work out a practicable basis of partnership between ideas and sentiments. Men recognize theoretically that ideas always appear swaddled in feelings. But many of us go about the day's business apparently on the assumption that ideas are as clear cut and unemotional as hammers or rifles. Hence our projects fail to capture men's hearts and imaginations. We have to recognize that, after all, reason in men is only the very tip of their iceberg of mental life. We live by our sentiments, even by our illusions. They furnish the real motive power which makes things go. They are at the bottom of our choices. And while educated choices are the prerequisite to any sort of social change worthy the name of progress, the process of education must include some canalizing of the sentiments. The reformer who does not include this in his program of good works is foredoomed to failure.

But it is notorious that in many of our fellow citizens

both sentiment and reason have been short-circuited into bathos and sentimentality. And the words "social reformer" have become almost an epithet of derision, because some would-be leaders with insufficient sand and iron in their systems have capitalized this tendency toward sickly softness, and, as a result, have scored personal successes with indecent haste, have scratched paths which could not be followed, and which must be resurveyed and laid out at great cost and inconvenience. I asked a friend recently about the speech of a housing reformer she had been urged to hear. "It was too sticky-mouthed," was the curt comment. But it is that very stickiness and sweet-sweetness, or the "tear in the voice," that scoops in votes and money from certain sections of the population. Some people are organically drunk, or so nearly so, that the slightest whiff of sentimentality starts them reeling; and a big dose may induce delirium.

Since social reform and social work must steer between the two dangers of cold, sterilized, depersonalized ideas and warm, saccharine, oily, oozy, intoxicating, overpersonalized sentimentalism, we must be sure that we recognize sentimentalism when we see it, and do not hit the wrong heads in the name of reason and clear thinking.

In the first place, *enthusiasm is not sentimentality*. George Meredith, the savage baiter of sentimentalists, remarked that "Nonsense of enthusiasts is very different from nonsense of ninnies." I doubt if any American would consider ex-President Taft as either soft-minded or tender toward the "sob squad." But he said recently, in a notable address, "Give me misdirected fervor, wild theories, if only the sincere spirit of service is alive, because the hard experience of practical results will temper this into useful activity later." That is, the enthusiast is honest, but the sentimentalist will fudge the truth and stage a lie if it will snare the silly fowl he is after. Here we must beware of confusing the issue by accepting the dis-

inction sometimes made¹ between social reform as "passionate" and economic theory as "intellectual." Such reformers as Plato, More, or Comte were not passionate. The real distinction, if there be one, should be made between theories of social reform and economic theory; or between social reformers and economic reformers. To illustrate: protectionists, bimetallists, ship subsidists, and *laissez faire*ists have been just as passionate in their way as are the most eloquent pleaders for "social justice" or eugenics, or single tax, or widows' pensions, or minimum-wage legislation. Professors of Greek defending some theory of interpretation have been known to fan up a pillar of fire equal to the most ardent enthusiasm of the most passionate social reformer. Human life is dynamic, and its calorie value may be expressed equally in the field of theory or practice. If acrimony be counted a species of passionate negative enthusiasm, I challenge any fair-minded person to produce from the field of social reform any person or project betraying more ardor of passion or prejudice than is displayed by the critics or opponents of reform. Enthusiasm for social reform is no more reprehensible than enthusiasm over breeding a new strain of cattle or formulating a new theory of value. Constructive social reform ought to look upon itself and be looked upon merely as the administrative aspect of a developing body of economic and political laws. It must recognize the limitations imposed by those laws, and without hysteria. But at the same time it is quite appropriate for the reformer to see in these "laws" only relative fixity, and to accept them only as working conventions, as shore marks of levels in the scientific and practical experiences of the past. This attitude of mind may be irreverent or heretical or contemptuous, with or without heat; but it is hardly to be called sentimental.

¹ See, e. g., W. H. Hamilton, "Economic Theory and Social Reform," *Jour. Pol. Econ.*, June, 1915.

Neither will clear thinking confuse sentimentalism with ideals, dreams, or Utopias. No thoroughgoing Utopist was ever sentimental; the more radical and complete his Utopia the less he is open to the charge. To take only one test, no sentimentalist would for a second think of breaking up the family; on the contrary, he weeps at the idea of a hard hearted juvenile court judge separating a child from its drunken and wastrel parents. But every Utopist, from Plato and Campanella and More down to Sir Francis Galton and the eugenists, has advocated some more stringent form of social control over the family. The "practical man" frequently makes the mistake of classing the "dreamer" with the softhearts. But while dreams may be wrapped in emotion they are often as devoid of sentiment as a formal syllogism. Sentimentality never leaves a solid precipitate; but remember once more that every institution, every invention, every sober gray law was once a dream in the heart of some human being. The social reformer must dream and dream magnificently; the very poignancy of his dream stings him into the attempt to cast it into the mold of realized fact. Because he dreams while other men merely slop about in feeling or stumble into hasty action, he may come nearer scoring a bull's-eye on the target of truth. That is why Aristotle seems to have counted the poet more reliable than the historian as interpreter of serried facts. The idealist, too, belongs rather with the dreamer and Utopist than with the sentimentalists. It is a matter of surprise and regret that such a really great social scientist as Professor W. G. Sumner should have heaped contempt upon ideals as a motive factor in social development; for ideals are really the finished sketches by which social reconstruction is to be guided. Ideals, Sumner says, are illusions. But so is a tool, so is a house, so is science, so is history, if you take the trouble to analyze them far enough. Every man who counts for anything in the world is an idealist. He is a sentimentalist only if he fails

to take his ideals seriously and uses the slapstick or exposes his beating heart in order to wring a spasm of factitious feeling from his audience. The genuine social reformer demands social reconstruction, not because existing arrangements are out of joint with his particular ideal scheme, but because he believes he can show that it is possible to replace them by others more in harmony with existing human character and human resources. Indeed, it takes a sturdy heart to be a real idealist. It was no mean-spirited or defeated man who could write *credo quia absurdum* as the key to the program of revolutionary idealism laid down by the pioneers of the Christian church: Tertullian was no tender-minded "soft pedagogist."

Moreover, *imagination is not sentimentalism*. Sentimentality never raised a single human being one inch above his old level. But, we are told, "moral evolution has consisted almost wholly in the increasing liberation of the imagination." The social reformer must not hesitate to use his imagination. Indeed, if he is to succeed at all, it must be in large part because he can slip into the skins of his fellows and put himself in their places. He must master the new "psychology of attitudes," which in plain English means the ability to use the imagination as a guide in interpreting prejudices and preconceptions. As Mr. H. G. Wells points out, if we are going to arrest our present pretty clear drift toward revolution or revolutionary disorder, it must not be through training a governing class to get the better of an argument or the best of a bargain; it must be through laying hold of the imaginations of "this drifting, sullen, and suspicious multitude, which is the working body of the country." It takes imagination to lay hold of imagination. Sentimentality will not do it.

We may pass by with only incidental reference the obvious fact that much of conservatism is merely sentimental attachment to what is old and familiar: the do-

tard is always sentimental. The young radical may be wrong-headed and self-centered, but he is less likely, by contrast, to be soft. He may be dogmatic, uncompromising; he may fit exactly Peacock's satire and say to himself,

After careful meditation
And pronounced deliberation
On the various petty projects that have been shown,
Not a scheme in agitation
For the world's amelioration
Has a grain of common sense in it, except my own.

But the more dogmatic, the harder he is. Radicalism and heresy run the risk of degenerating into sentimentalism only when they, too, have been passed in the race and are about to be relegated to the shelves of conservative and accepted truth.

The "practical man," whether he be a social reformer or whether he decry meddling with the social order, is frequently if not always a bit of a sentimentalist, just as the dotard conservative and the self-made man and the amiable, easy-going parent are sentimentalists; and for much the same reason. They all are inclined to drivel over their own pet virtues, to fondle them, to make them the ready excuse for certain ineptitudes in thinking or certain gross breaches of good taste.

It is precisely these practical conservative men and women who are so suspicious of preventive measures in the field of charitable relief. They sentimentalize over the maintenance of existing class lines and fear any move to eliminate the patron or to promote real independence and self-help. A sweet, pretty, friendly visitor, of the type that goes calling on the poor in a limousine, was discussing socialism recently with a student. "Good heavens!" she cried, "I don't want any of this horrible socialism. If we get socialism I won't have any poor to visit." Nero is still in our midst, stimulating his di-

gestion by parading the poor before him. I hoped, evidently in vain, that we had buried the attempt to store up merit by practicing on the poor. It is just these parasites who have brought discredit upon the phrase "social service." I confess a growing tendency in myself to delete it from my vocabulary, simply because it is so often a mixture of pious cant, meanness, cloudy vision, and sentimentalism.

So far our analysis seems clear enough. But now comes a troop of questions not so easily answered. Is it sentimental to be interested in one's fellow men? Is it possible really to love them, or at least to have some social regard for them, their rights, their interests? Or have all the lovers of mankind been merely soft pretenders? Is "enlightened self-interest" the only safe guide out of the sloughs of sentimentalism? A recent lecture by a prominent business man closed with this stirring appeal and Godspeed to his student hearers: "I hope you all make a barrel of money!" Shall we lie tamely down, accept the tip, and pass it along to ardent youth that the only things worthy the interest of sane, healthy, virile, scientific, sensible men are stocks and bonds, laws of exchange, principles of finance, and the whole round of mere money grubbing? Or permit to go unchallenged that time-honored fallacy, the economic man? Shall we brand as silly and sentimental the principle that we are all part and parcel of each other, a principle as sound in sociology as it is in ethics? Or shall we lay as the basis for all social polity, all social legislation, all social reform, the absolute rock of fact, namely, that we are each and all of us social to the very core, and that we are only real men and women as we are vitally interested in others and disposed to coöperate with, as well as exploit, them? Sociology is not sentimentality. It is not merely the science of making poor folks richer and happier at other people's expense. It is a science in the making which is attempting to tell us that we are hopelessly

bound up one with the other, and that none of us are safe or sane so long as any stupid, wretched, ignorant, or profoundly miserable folks are tolerated in our midst. Interest in fellow men turns out to be science, not sentimentality.

Here we might stop and summarize. Sentimentalists, it appears, are essentially parasites, spiritual Malaprops. They are cheats, who try to get something for nothing. They are, as George Meredith declared, "they who seek to enjoy without incurring the Immense Debtorship for a thing done"; and their practices "a happy pastime and an important science to the timid, the idle, and the heartless; but a damning one to them who have anything to forfeit." They are the folks who decry organized effort to prevent poverty and try to obtain a bargain-counter dose of warmth and coziness from a nickel slipped to a street beggar or from a bunch of dirty cast-off clothes conferred upon the worthy poor on bundle day. They are the people who drive us to madness by their "impaired waterworks." I am reminded of the matinée idol who, exasperated to the quick by ill-timed tears, blurted over the footlights, "Now, ladies, please: I want you to cry, I'm paid to make you cry, but for God's sake cry in the right place!" "To everything there is a season," said the Preacher; "a time to weep and a time to laugh." But he assigns no place to sentimental insipidity, for every sane man knows that sympathy must always walk with science. It must never get away from understanding and must always be sure that it is playing in time and tune. That is why we give short shrift to both the person who is always "feeling his feelings," and to the "Gawdsaker." The "Godsaker," according to Wells, is the curse of all progress, the hectic consumption that kills a thousand good beginnings and promising experiments in social welfare. He is "the person who gets excited by any deliberate discussion and gets up wringing his hands and screaming, 'For Gawd's sake, let's *do* something *now!*'"

There is no lack of concrete social problems confronting the reformer by which to test our analysis of sentimentality. In some quarters it is still considered sentimental or worse to speak of the abolition of poverty. But Professor Hollander and other economists are proving statistically that the modern civilized world is producing or could produce enough and more than enough of food, clothing, and shelter to provide decently for every human being; hence that poverty, as we are familiar with it, is unnecessary. Poets like Heine, anarchists like Kropotkin, and socialists like Hertzka told us this long ago, but we smiled indulgently and called them dreamers drunk with feeling. But now that the problem can be put to us in mathematical form and pictured in statistical graphs we begin to foresee the solution of poverty as not only practicable but as good form.

The same holds true of the problem of unemployment. Men were called sentimental who declared that a reserve pool of underpaid and irregularly employed laborers is not only bad ethics but bad business. The prevailing business code held, and it still holds in certain financial circles, that under-employment is in the nature of things, is one of the laws of economics; and that therefore it is as useless to try to solve the problem of unemployment as to solve the problem of gravitation. But the president of the Steel Trust woke up to the fact that perhaps this business axiom was wrong, and became chairman of the New York Committee for the study of unemployment. Not long ago the president of the American Blower Company scattered widely copies of the Detroit plan for relieving and perhaps eliminating unemployment. These men—and their number is increasing—are not sentimentalists. Several years ago the greatest authority on unemployment in England declared that “practicability is never anything but a relative term—dependent upon the urgency with which an object is desired and upon the inconveniences which men are prepared to undergo in its pur-

suit. It is practicable for most people to run a mile to save a life. It is not practicable for any one to run a mile unless he is prepared to get warm. So it is not practicable for a nation to get a mastery of unemployment without being prepared to submit to some change of industrial methods and customs." That this was sound sense and not sentiment is amply demonstrated by the fact that the social urgency bred by the crisis of war so re-organized British industry that unemployment was less than at any other time in the last thirty years.

Much criticism of the existing industrial order is branded by standpatters as ebullition of parlor socialists and extravagant youths fed upon too much sociology. But President Taft, in his message of February 2, 1912, recommending a commission on industrial relations, took occasion to say: "Numerous special investigations, official and unofficial, have revealed conditions in more than one industry which have immediately been recognized on all sides as entirely out of harmony with accepted American standards. It is probable that to a great extent the remedies for these conditions, so far as the remedies involve legislation, lie in the field of state action." What clearer sailing orders could any social reformer ask, and who would charge their author with ebullition?

The whole tendency toward state control over wide areas of social activity spells sentimental degeneration to the old-fashioned *laissez faireist*. One of the first notable court pronouncements for state control occurred in the famous case of *Munn v. Illinois*. The United States Supreme Court held that "when one devotes his property to a use in which the public has an interest, he, in effect, grants to the public an interest in that use and must submit to be controlled by the public, for the common good, to the extent of the interest he has created." The court later, in a great decision compelling railroads to equip their cars with safety devices, rejected the plea of the railroads that the law would work hardship upon them.

It accepted Lord Eldon's maxim that it is better to look hardship in the face than to break down the rules of law, and went on to point out that a preventable accident injures somebody: "Such an injury must be an irreparable misfortune to someone. If it must be borne entirely by him who suffers it, that is a hardship to him. If its burden is transferred, so far as it is capable of transfer, to the employer, it is a hardship to him. It is quite conceivable that Congress, contemplating the inevitable hardship of such injuries, and hoping to diminish the economic loss to the community resulting from them, should deem it wise to impose their burdens upon those who could measurably control their causes, instead of upon those who are, in the main, helpless in that regard."

The court may have reasoned fallaciously, but very few critics have charged it with erring on the side of sentimentality in cases involving the police power or social reform in general. If American courts are sentimental at all, it is in the other direction; that is, toward soft-hearted regard for precedent, for the old, for the well-established.

Perhaps in no other field of social reform has the charge of sentimentalism been so persistent as in attempts to reconstruct our tax systems. I have no brief to file for any particular scheme of financial reform, but I do suspect that the so-called tax experts are frequently either disingenuous or sentimental when they fly at the head of a reform proposal and brand it as "the economic folly of taxing productive forces into despondency." I am inclined to feel that even the most extravagant and aggressive tax reformers have a right to a serious hearing, particularly after reading the conclusion of a recent Massachusetts tax commission to the effect that the "study of the commission revealed that there was no science of taxation save that of its evasion."

Again, the demand of labor and labor's apologists for what they call a fair share in the products of their toil

may sometimes exude sentimentality. But what of the deliberate attempts to provoke sentimental responses made by labor's opponents? What about the myth of "widows and orphans"? Or the drool about free trade and empty dinner pails? On the first day of the great Lawrence strike the president of the American Woolen Company said in the course of a public statement: "While manufacturers under normal conditions would be glad to see their employees earn more money, the Massachusetts mills are paying all that they can afford to pay in the present situation. The mills are still suffering from a long period of extreme depression due to the tariff agitation at Washington." Yet we are assured by a reputable authority that one of the very factories in question had paid for itself, equipment and all, in the two years since its completion. Is criticism of such mendacity sentimental? Is it sentimental to criticise the Colorado situation? The report of the Colorado Bureau of Labor Statistics for 1909-10 stated baldly that the Colorado Fuel and Iron Company sought to nullify and violate laws calculated to protect the interest of the miner and used its "powerful influence to defeat the enactment of any law that had for its purpose the safeguarding of the lives and health of its employees."

We all recognize that no little perverse sentimentalism has gone into the plea for restrictions upon the labor of women and children, and we condemn it without stint. But what of the sentimental interest of employers in maintaining woman's right to work as many hours as she wants to, or in permitting children to become captains of industry at any age they please? People, strange as it may seem, are still able to stir up a claptrap sort of sentimental indignation over the poor widow whose child is prohibited from following his calling as newsboy or gum-seller or messenger boy on city streets late at night. Other people are still gullible enough to swallow the sentimental appeal of the less efficient employer for aid in

averting the destruction to industry and to nation if child labor is withdrawn or if the twelve-hour shift for men and night work for women are prohibited. Such feeble folk need some such bracing and manly tonic as a notable Connecticut employer gave not long ago on the subject of child labor. He said, "We are not here primarily to do business; . . . any business which employs children so young that their physical and moral growth is dwarfed and stunted is, to the extent to which it so employs them, an evil in the community, and not a benefit." But a lot of patient, hard thinking must be endured by a considerable section of the public before it becomes quite immune to such patent disregard for social welfare under the guise of sincere pleading for the "worthy poor." Not all police or school authorities are yet immune. Some are. I remember hearing the superintendent of a California cannery fly into a passion one day and declare that he could whittle out of a shingle better men than the local school board because they were so sentimental as to insist that the schools should open on the day set by law.

Is it sentimental to show up and to fight the state of business mind illustrated by the following editorial in the silk manufacturers' official journal?

"An ideal location would be one in which labor is abundant, intelligent, skilled, and cheap; where there were no labor unions and strikes; where the laws of the state made no restrictions as to the hours of work or age of workers; where people were accustomed to mill life; and where there were no other textile mills in the vicinity to share in the labor and bid up its price. . . In towns where there is a fair population and no manufacturing industries of moment a good supply of female help can usually be had at low prices; but should other industries come to the town, the demand for help may soon exceed the supply and the employer find, owing to the bidding up of the labor, that its cost is greatly increased, and its character arrogant and independent, and with no growth to the town equal to the increasing employment offered, he finds himself in a very uncomfortable position. . ."

This is just that combination of shrewdness and driving self-pity that disgusts us in a loquaciously drunk man or woman. A friend of mine was once indiscreet enough to volunteer to pilot a drunken woman homeward. The woman leaned heavily on her, and they zigzagged down a crowded sidewalk, to the incessant refrain, "My heart is broke. Now would you believe it? My heart is broke. Now would you believe it?"

Only Shakespeare and a jury of angels could unscramble the mixture of sentimentalism, piety, and probity which every social worker or reformer sooner or later encounters. Perhaps nowhere is he more likely to run afoul of it than in the field of housing and sanitation. Here is a sample: The president of the Sloss-Sheffield Steel and Iron Company, of Birmingham, Alabama, wrote an indignant protest against the report of Birmingham's industrial conditions published in the *Survey* early in 1912. "Why [he cried], who is there in his right senses will deny that hogs are the natural and logical scavengers of a mining camp? Sanitary conditions in a mining camp! Pooh! I'd rather have twelve hogs than fifty men cleaning up my camps!"

This is the grotesque side of such drunken slaver. But sometimes the intoxication is much more subtle. The report of the New York Consumers' League for 1910 described an interview with a prominent Philadelphia merchant at a settlement house in which he was deeply interested. He said: "I have 1,200 girls working for me. These girls come to me healthy, happy, full of spirit. They work a year and grow thin and sickly and then go home, and come back again after a while, and work a little longer and go away too weak to work, and I find they have died of tuberculosis. But nothing can be done about it. It is the dust in the air." "But," said his interlocutor, "surely something can be done. You could remove the dust in the room by opening the windows." "No [he went on], we cannot open the windows, because it creates

a draft which moves the dust from the machines and impairs the purity of the white cloth. It would bring less in the market and my stockholders would not stand for it."

Crocodile tears; disgusting crocodile tears.

In such cases the real sentimentalists are those ready apologists for spiritual wickedness in high places, those who whitewash the business gorilla and indict his critics. Let me cite a flagrant example. In September, 1911, the dam owned by the Bayless Pulp and Paper Company broke and wiped out the town of Austin, Pennsylvania. The engineering journals bitterly condemned the owners and constructors of the dam, and charged that the disaster was without excuse, because the owners knew only too well that it was a flimsy and menacing structure. But a neighbor of the owners said after the coroner's inquest over the seventy-six victims: "Throughout the whole community these men stand well. They are exceedingly fine characters—capable, honorable, and public-spirited. . . They are liberal in their help to some of the most worthy causes in the city, and their wives also are similarly interested. . . I have talked with many people since the terrible disaster at Austin, and I have not yet heard one harsh or bitter word against either of these men. . . I saw them both for a few minutes on the day following the disaster. They were utterly prostrated. Neither of them is physically robust or rugged". . . (etc., *ad nauseam*).

This is simply a survival of the ancient cult of criminals; the elder, vigorous superstition has merely faded out into mawkish, reverential sentimentality. There is little to choose between the sentimentalism of unbreeched reform legislation and the sentimental vacuity of benevolent feudalism.

We all agree that many grievous blunders have been made in the field of social pathology through poor-law administration. And I think none of us would deny that sentimentalism has gone hand in hand with a certain

hardness and dogmatism in the interminable debates over public-poor-law policy. But we must never forget that there is a sentimentality that bewails the shiftlessness and thriftlessness of the poor while condoning identical qualities in the pauperized well-to-do. It is just that very sentimentalism which breeds disastrous forms of social counter-selection against which social reformers train their guns. Their aim may be askew: Mr. Carnegie's scheme for abolishing large inheritances, for instance, may be a poor sort of projectile; but the target is plainly visible to anybody who will take the trouble to look straight.

Sentimentality plays havoc in the domain of child welfare. It has killed a thousand times more babies than perished in Herod's massacre. Nearly anybody with a slight equipment of passing good looks and a bit of nerve can organize and foist upon the soft, credulous public a charity for babies or children. "Save the kiddies" will wring tears and dollars from thousands who would pass unheeded a call to "Prevent infant mortality." Time was when any little company of good ladies could open an orphanage or home for foundlings. And nobody seemed to think of connecting sentimentality with the tremendous death rate in those jerry-built institutions, or with the narrowed, hampered, and broken lives in store for the pitiful survivors. So long as one was "doing good," he or she could not be held responsible for such grievous results. Hence when state boards of charity proposed to visit, inspect, and check up these children's charities they were charged with hard-heartedness and coldness and meanness and lack of elementary human sympathy. The same story might be told of the foundation of "tours" for the reception of illegitimate infants. They permitted baptism and the saving of souls, but they promoted infant mortality, desertion, and illegitimacy in the name of good works.

It is quite possible to refuse complete assent to the

over-wrought pleas of the eugenists and workers for prevention of feeble-mindedness, to recognize the sentimental twang in much of the chatter about race suicide and the fittest racial stocks, and still to support reform legislation aimed at taking out of their families those feeble-minded persons who seem to menace the welfare of a community. There has been altogether too much sentimental red fire over the threatened break-up of the family when a social worker or a court attempted to remove a feeble-minded household drudge from lazy or designing parents. And it is sentimentality of a peculiarly rancid sort that crows over a clever job done when it has succeeded in marrying off a feeble-minded village butt. In this connection may I protest in the name of decency against those sentimental judges who think they have solved the problem of happy marriage and community peace when they coerce a young rake into marrying an impressionable girl who succumbs to his seduction, or when they tell two people in whom the light of love has burned out to "go right home now and make up"? Let no man join what God hath put asunder.

In housing reform much sleazy work has had to be undone and done over because people have felt and wept and legislated first, and investigated afterward. Shame and disgust over the presence of nasty housing conditions in one's city only become efficient shame and cathartic disgust when they are illuminated by the fullest study in the coolest frame of mind of the widest possible array of facts from one's own and from other cities. The tear in the propagandist's voice must be balanced by tolerance and determination to know the truth on the part of the constructive reformer. Whether housing laws come or not is a matter of secondary import. A tenement law based upon tears is either repealed or pigeonholed.

In this analysis of sentimentalism I approach with a good deal of trepidation the subject of mothers' pensions. Without attempting to pass upon the merits or demerits

of such pension legislation, or without deciding whether or not mothers' pensions are merely left-handed outdoor relief, it must be noted that much of this legislation in its rapid spread from State to State has been in the nature of sentimental infection. In by no means every case have its protagonists considered carefully their local problem—they have heard of such laws in other States; they have "caught the spirit"; they have simply responded to suggestion and imitated, or seen a chance to win popularity. It is an example of mob mind; you will recall that mob mind is a social phenomenon in which thought bears an inverse ratio to feeling. It is unnecessary and perhaps altogether unwise to ask for the repeal of any of these laws. But it surely is the path of sound social policy to ask that any further demands for the extension of similar legislation should be met with counter-demands to show proper grounds of fact and not mere vaporizings over the perhaps mythical virtues of home life as it is not infrequently practiced.

The sentimental doer of good plagues the constructive reformer in many spots, but of the whole devil's brood of sentimental inventions none is more exasperating than the "Tag Day." In some American cities every day seems to be Tag Day. We are held up in the streets to buy a miserable little paper flower for the orphans, or a wilted real flower for the cripples. And in Pittsburgh a while ago women on the streets and signs on the street cars bade us buy a tag and save a soul at the rescue mission. Such sentimentality not only defrauds legitimate welfare work, it also hinders the development of sound institutional finance and recruits the army of street beggars.

Only second to Tag Days in their potential irritation to the healthy-minded are subsidies from the public treasury granted by sentimental legislators to private charitable enterprises coddled by their sentimental constituents. I am not here concerned with the charge that

such subsidies are a "slush fund" for financing corrupt politics. I am rather tilting at that attitude of mind which the legislator assumes when he answers a critic of some notoriously inefficient applicant for subsidies with a benevolent smile and an emotional quaver: "Ah, but they're such nice people; they mean so well; they aren't your cold, hard, scientific folks who ask a lot of questions and do nothing; they mean well, and they do a lot of good. Ain't that what we're here for, to do good?"

The most dangerous aspect of these movements for Tag Days, Bundle Days, Mothers' Pensions, and the like is that they represent "organized emotion." Mob mind in the old days was fairly easy to control, because it could be localized, shamed, or frightened out of itself. A cannon, a troop of mounted police, or a persuasive orator could disperse it. But modern means of communication—newspapers, magazines, reports, telephone, telegraph—all permit mob mind to gather headway almost imperceptibly over wide areas. Whole cities, states, and even the nation may be caught in its swirl. The newspapers, always on the alert for the "human interest" story, will exploit anything not absolutely tabooed or libelous which will move to tears. The cardinal virtue in newspaperdom seems to be not exact truth but "punch"; and punch must be considered as the technique of obtaining attention under false pretenses, the "ability to achieve the end without the means"; not the art of getting results, but the legerdemain trick of getting an appearance of results. The sentimentalist, needless to say, fails to see through the trick. Moreover, certain questionable associations, like the notorious Mothers' Pension League, conduct a nation-wide propaganda for profit. Such subtle stimulants to emotionalism can be neutralized only gradually by requiring that the journalist's professional training shall include the study of economics, finance, social legislation, and the administration of charities and correction; and by nerving social

workers to stand resolutely against any compromise with buncombe.

Certain types of social work, too, are constantly menaced by the danger of cultivating a sentimental attitude. A settlement head resident tells me she has tried to find out why so few students attending training courses for social work choose settlement work as their career. One young woman whom she asked replied directly, "It's because I don't want to just sit around and be an influence!" In settlement work and probation, friendly visiting and amateur case work there are always some people who putter about everlastingly and never get anywhere; they scheme and fuss and waste their own and others' energies getting and maintaining what they call a "friendly contact." Now all social welfare work rests at last upon friendship, but, as any one knows who has read his Emerson, friendship is something infinitely greater than emotional ooze.

It should be perfectly apparent by this time that the Promised Land of wholesome social life cannot be seen clearly by eyes dimmed with easy tears; nor can the calls to constructive social work be heard above the thumping of a fluttery heart. Social reform of any and every kind must be thought out and carried through in the scientific spirit. No one should insist that it confine itself to statistics and a cold, hard voice. It must, if it be truly scientific, utilize to the fullest every worthy quality of human nature—sentiment, humor, imagination. The great religious teachers, the master dramatists, the makers of modern science, knew the secret of communicating their visions. Huxley could kindle enthusiasm for evolution just as effectively as Shakespeare evoked faith in a moral universe through *Macbeth* or *Lear*. Social reformers should likewise take their cue. In a word, social reform must more and more get away from any suspicion of driveling appeal to the froth in human nature, and must learn the art of purging its ideas with facts and

of projecting those ideas upon the plane of imagination. The leaders who can learn this art will steer a safe and fruitful course between the timid and squint-eyed stand-patter on the one shore, and, on the other, the silly dabbler who thinks this old world of ours can be changed by a turn of the hand or a quickened heartbeat. To them must be committed the job of applying W. S. Gilbert's famous remedy for foolishness:

"On fire that glows
With heat intense
We turn the hose
Of common sense,
And out it goes
At small expense."

The rule is admirable if the streams supplying the reservoir can be kept fresh and flowing.

It is perhaps beside the mark to inquire which science or group of sciences may hold the master key to this delicate art. But at least enough has been said to hint that while sociology may well be "first aid" to sick communities, it is not to be considered as the good-looking doctor who allows female hypochondriacs to weep on his shoulder and sentimentalize over their imaginary woes. Those of us who have assumed a certain leadership in applied sociology must set our faces resolutely against tremulous haste or muddled sentiment in the process of instigating social change. And while maintaining hospitable, elastic, open minds, we must discipline ourselves to the practice of that decent reticence and self-control which ought to mark a real profession, and which come only from rigorously thinking through a mass of evidence proportionate to the gravity of each problem as it rises in the day's work.

Am I leaving the impression that the social reformer must be a monster of blood and iron, or that social amelioration must be a policy of *Schrecklichkeit* as bitter and

unrelenting as natural selection? I have, it is true, been emphasizing, for the sake of arriving at a proper balance, the negative side of this problem; but not by any means to the exclusion of its positive aspects. Because we are human beings dealing with other human beings we must have, as I said at the beginning, warmth, imagination, enthusiasm, heroic self-sacrifice, and plenty of them; but all these amiable qualities must be conserved, knit together, focused, and reënforced by the will to think clearly and the will to know profoundly. When faith and love, vision and disciplined intelligence can be welded into one, we shall have such a corps of expert leadership that the very gates of hell itself shall not prevail against us.

CHAPTER VI

THE DEAD CENTER IN SOCIAL WORK

I

If clocks did not run down after they were once wound up, and if people and things did not tend eternally to gather moss, how much simpler would be the problems of life; how much simpler our social work. Indeed it is pretty safe to say that there would be no social work at all. Social problems arise in the main from faulty adaptation. Some persons and institutions just happen, others live too long, still others never seem to reach the point where you can say of them that they are really alive at all. Some live and work fairly well for a time, then suddenly come to a standstill. Nothing is more embarrassing than a machine that without warning stops functioning at a critical moment: say, a machine gun that jams on the firing line, an automobile that goes dead when you are miles from home, or a locomotive that refuses to start its load on a slippery track. In mechanics this phenomenon is called the "dead center," which engineers define as "the position of a crank when the turning moment exerted on it is zero", or "the point where a connecting rod has no power to turn a crank."

Discarding all thought of attempting a bad pun or of applying the analogy too rigorously, I still believe a similar phenomenon is common in communities and individuals. We speak of "dead towns" or "backwater communities"; this public official is a "dead one," his rival a "live wire"; students "go flat," athletes "get stale." A Harvard professor boasted that he hadn't changed a word of his courses in thirty years. He had been dead-

centered for a quarter of a century. A successful college president told me a while ago he was so swamped with routine that he hadn't thought two consecutive fresh thoughts in five years. The superintendent of La Petite Roquette, the detention prison for young offenders in Paris, became convinced a few years ago that the dietary of his institution was insufficient, and directed the cooks to modify it according to his plans. They rebelled. Had the present diet not been going along nicely for a hundred years? Why change? Innovations are odious to the dead or sleeping. When I entered the probation office in San Francisco a good many years ago the case records were kept on narrow strips of cardboard to fit into an ordinary folded legal-document envelope. They were almost impossible to manage; we could scarcely get them into a typewriter, and, if we succeeded, but little could be said within the cramped space. Time, energy, and patience were wasted; our work was hampered; only huge efforts could offset the inherent clumsiness and deadness of such a record system. I waited for something to happen, not wanting to be the new broom. Something did happen—the great earthquake and fire came along and cleared out every record blank of every sort, made a clean sweep; we had to begin from the bottom. What an opportunity for a new system! Yet think of the price—Providence and a hundred-million-dollar fire—to jerk us out of our dead center.

Such inertia is overwhelmingly expensive. It is the most costly phase of "good works"; it forms by far the largest part of our bill of wastage. When we talk of economy and efficiency or conservation of natural and human resources we mean in the main overcoming inertia, routing somebody or some institution out of a state of suspended animation. And most of the talk about scientific management or canons of efficiency centers about this same problem of applying energies, now wasted, to connecting rods in such a way that cranks will turn.

Civilization might be defined as an attempt to achieve steadiness, persistence, and economy in the application of energy. The animal is born with instincts and acquires habits which act as his balance wheel, but only in rare instances does he create of himself anything to correspond to the human institution as a steadier. Despite instincts and habits both animal and primitive man lack the persistence and continuity of effort which we ascribe to civilized man. The great problem of social evolution seems to have been the changing of an alternating current into a steady flow, the substitution of ideals, motives, disciplines, institutional forms and regulated social pressure for the mere ebb and flow of primal instinct and feeling. But the goal is not yet achieved. You and I still vibrate between the pit and the seventh heaven. Social institutions, like factories, vary in their day-by-day output. And steadiness may be so exaggerated as to become a vice instead of a virtue.

Says Mr. Dooley:

"Yes, Prosperity has come hollerin' an' screamin'. To read th' papers, it seems to be a kind iv vagrancy law. No wan can loaf anny more. . . Prosperity grabs ivry man be th' neck, an' sets him shovelin' slag or coke or runnin' up an' down a ladder with a hod iv mortar. It won't let the wurruld rest. . . It goes around like a polisman givin' th' hot fut to happy people that are snoozin' in th' sun. 'Get up,' says Prosperity. 'Get up, an' hustle over to th' rollin' mills: there's a man over there wants ye to carry a ton iv coal on ye'er back.' 'But I don't want to wurruk,' says th' lad. 'I'm very comfortable th' way I am.' 'It makes no difference,' says Prosperity. 'Ye've got to do ye'er lick. Wurruk f'r th' night is coming.' Get out an' hustle. Wurruk, or ye can't be unhappy; an' if th' wurruld isn't unhappy, they'se no such thing as Prosperity."

Whether we must be ceaselessly active or work intermittently can only be determined pragmatically. By our fruits must we be judged. Here, then, comes in the use of scientific tests, of measurements, of gradings.

II

In the judgment of social work, scientific efficiency tests will have to be applied to both institutions and individuals. Let us begin with the institution. A survey will usually bring out the state of a community's armor for social defense; it will show the absolute gaps that need filling, the spots where the armor is worn thin, the places where it is so thick that instead of protecting the community, the community must spend itself in supporting this dead weight. From this standpoint social surveys must more and more take on the character of city plans; and the arrangement and distribution of institutions to meet community needs should become more and more a branch of social and civic architecture.

A community that tolerates unnecessary duplication of its charitable plant is dead-centered. But how much duplication is necessary or permissible? Should every group of well-intentioned women or every religious sect be allowed to start an orphanage or hospital or mission merely because they want to? No more than every person who has a grievance, however petty, should be allowed to indulge himself in the joy of litigation. We begin to recognize that private charity is a public trust and have made a start at inspection and licensing, but only a bare start. To make that supervision fair, some technique of accurate judgment has yet to be worked out. This applies equally well to the problem of deciding when a particular institution is dead-centered, *i. e.*, when it has outlived its usefulness. Social structures, like the human appendix and other vestigial organs, tend to persist long after their original contribution to well-being has been used up. Have we not all encountered organizations like the legendary Ford automobile that ran nine miles without gasoline, simply on its reputation? The history of philanthropy is full of examples of the dead hand, the maladjusted endowment, of "vested rights" to doing good of a highly needless and even a

vicious kind and in a particularly heedless way. In no other field, perhaps, does time make ancient good so quickly and manifestly uncouth.

Social control over vestigial philanthropy must become very much more vigorous before we can be assured of relief from the inefficiency and loss it now entails. But again, we run against the difficulty of not having a sound system of grading. We assume, at least for all practical purposes, that we can tell when a man is dead. The doctor has certain objective tests like holding a mirror over the man's mouth. And the coroner's jury solemnly and confidently register the verdict that So-and-So has yielded up his vital spark for good and all. But where is the doctor or coroner's jury who can perform the same functions of test and autopsy upon a suspect charitable institution? What sort of mirror could be devised, or how secure a coroner's jury for such a job? Social work is still graded largely by whim, by sentimentality, by contagious approval or disapproval radiating from some powerful personality; by fad or craze; by petty grievance or pettier ambition, vanity or pique. These are the attitudes that determine newspaper backing or criticism; that feed or dry up reservoirs of private benefaction; that dictate legislative votes and appropriations.

Some provision must be made for pruning dead social branches or for absorbing useless and cumbersome accumulations of social tissue in the form of bequests, endowments, and the other elements of philanthropic equipment. I cannot go into the details of such a policy of social control, nor am I competent if I had the time. I may suggest, however, that as social life is organic and in a constant state of flux, and as our bodies are said to undergo a complete change every seven years, we ought to take account of our social equipment at least every ten years and ought to provide for a technique of survey, grading, and judgment, accurate and rigorous enough to relieve us of the incubus of charitable survivals and to in-

sure that no really useful organization for social welfare will be cut off.

But, you may say, why not trust to natural selection to perform this useful act of review? Of course in the long run the principle of selection does operate, and the inefficient or dead institution will be exterminated. But social life by its very nature tends to nullify this rude selective process. Hence things sometimes survive because of a fictive value. The business of the statesman and social worker, then, is to point out real values, to rub off the tinsel, to show up the fool's gold and uncover the unmistakable precious metal. How much of real gold and how much of gold brick is there in the philanthropy of your community? You must be able, social workers, to assay your social agencies for the benefit of an all too credulous public that still fails to see how coy looks and fair words do not mean sound social work.

Another phase of organized philanthropy must be passed over with bare mention. Organized welfare work means system. But it means dead center when it is so thoroughly reduced to fixed rule and routine that everybody knows just what to expect. In other words, the sociological principle of *anticipation* comes into play. Thus the beggar learns to know that the business man or the charity society of a certain neighborhood relaxes at certain seasons; the tramp knows a given house or town as "easy"; deserting husbands know the compassion of a certain group of benevolent women for deserted wives; the young delinquent soon learns to "know the ropes" of court procedure; the alien learns by heart the answers he must make to get his naturalization papers; the shopkeeper notices that cheap boarding houses for young women are the hobby of some of his fellow citizens and figures that he can pay lower wages. The really necessities frequently hide their misery rather than be drawn through the knothole of an unvarying procedure of investigation. A moribund organization stands by its

"principles," its system, its methods; it is inflexible; believes in creation by fiat and plenary revelation; shies at any notion of progressive development of truth. The live organization is adaptive, mobile; its guiding principle is to *anticipate anticipation*.

III

Did you ever see a town or a social agency suddenly blaze out into new life as by spontaneous combustion? I never did. The reason is that such things don't happen. Communities tend toward the thick mud of the rut and do not know the art of pulling themselves out by their own bootstraps. When an agency or town gets a new lease of life it is usually because of crisis: new blood, strangers who come with ideas, angels bearing visions, a new invention, the sudden strain of having to compete with a rival, or threatened extinction. Usually the inertia is overcome, new power added, the crank set in motion once more, by personalities whether hostile or friendly. Just because dead-centered persons make dead-centered agencies and because live wires vivify social institutions, it is vital to know how people work, what feeds their energies, what makes them "peter out," what gives them second wind, and what finally sends them to the scrap heap.

This is a field which scientific investigation has barely descried so far. We hear of efficiency systems in factory management, of vocational guidance, and of business psychology. But of this interesting attempt to determine the principles of liveness and deadness in the business world, little account has been taken in social work. Once or twice within the last year or so a demand has been made that we social workers analyze ourselves and our jobs. But little or no response came. With all the diffidence born of tackling a new field I prepared a set of questions which were submitted to several hundred social workers in various fields and in several cities. The idea of

the questionnaire was to find out whether social workers in their daily rounds were exceptions to the general psychological principle that people work by ups and downs, that they get into ruts, that they strike dead centers. I wanted to find out primarily the things or conditions which hinder the individual from doing his best, and which multiplied and prolonged finally land him in the dumps of inefficiency or self-reproach.

So far no detailed individual intensive tests have been devised for social workers such as the experimental psychologists have applied to the learning process in general or to such problems as telegraphy, foreign languages, typewriting, and stenography. These things can be reduced to measurements and order more easily than social work. The laboratory tester can set down so many words per minute as my output in telegraphy to-day; so many to-morrow; so many next week, next month, in three months, half a year, and so on. He can plot my curve of learning or productivity easily enough, noting my gains in power, my lapses and my steady ploddings. He can also discover many of the factors back of my variations in accomplishment. But the kaleidoscopic variety of social work and the inherent difficulty of reducing that variety to some measurable unit makes our problem much more complex. What should be our unit quantity? The number of cases handled or solved per day? Families treated or rehabilitated? Boys saved or improved? Dispensary patients cured or visited? Homeless men fed, settled down, married, put to work, or passed on? Ex-convicts reclaimed? Drunkards and would-be suicides salvaged? Number of hours or days per case? Per capita cost? Energy expended? Calories of food used? You see the complexities. They have nothing to do with whether social work is a profession or not, for the same complexities crop out in the attempt to apply efficiency tests to preaching, medicine, law, and teaching. The prime difficulty is that all these profes-

sions are creating—as their chief business—certain intangible, imponderable values, which though almost beyond human measurement are nevertheless the most real things of life. Who can measure health or spiritual well-being or culture in absolute units? Yet some measure, either direct or indirect, must be found to prevent professional misfits, wastage of valuable energy, and the sense of futility which sometimes threatens to engulf the most poised and optimistic of us.

During the past fifteen years several educational psychologists (Bryan and Harter, Swift, Johnson, Book, Thorndike and others) have been experimenting on the process of learning. All agree that progress in learning is never steady but always by jumps. In diagramming their results, figures like the following appear:

Each of these curves shows characteristic peaks and valleys connected usually by fairly level spaces, called technically "plateaus of learning." These plateaus mark the learning of chemistry, of telegraphy, foreign language, music, mathematics, ball-tossing, whist, chess, and checkers. To adopt my own term they represent *deadcenters*.

Now some extremely interesting conclusions crop out of these experiments in locating and diagnosing dead centers, which are highly significant to the learning of technique in social work. In learning a foreign language two great plateaus occur: the first just below the point of so-called "working proficiency"; the second, just below "complete mastery." Another point of vital importance is that "equal amounts of work do not produce equivalent results;" that is, the time element in learning must always be reckoned with in determining the relation between effort and result. Further, one of the salient marks of learning is habit or automatic control, and this automatization goes on throughout the process of learning, but suffers ups and downs. Still more significant is the fact that dead centers suddenly disappear almost overnight, just as spring some April evening seems to summon every reserve to break through the crust of winter, and we wake next morning to a world of new glory, or as names suddenly pop into our heads after long periods of ardent quest in vain.

Granting that plateaus or dead centers occur, what do they mean? You may interpret them as "resting places in effort" or breathing places or periods of assimilation, reflection, digestion, adjustment, incubation, like the lulls between the assaults on Verdun. They warn of conscious or unconscious mental revolt against further crowding and cramming; they are hints of mental or moral indigestion. "Plateaus have at least two causes. Considered from the point of view of automatization they are resting places. The learner has overshot his permanent power and must wait until the automatization

is perfected. They are also due to a slump in enthusiasm. Monotony overcomes the learner. Further, these two causes react upon one another. . .” In the study of chemistry at the University of Indiana a plateau known as “the period of depression” was recognized. Students showed a phase of rapid improvement in the first months, followed by a long period of slow progress. This was not due to any inferiority in the latter part of the laboratory manual. It came from the difficulty in assimilating the large number of elementary facts learned at the beginning. When the student’s attention could finally be turned from this mastering of tools his curve began to rise again.

We can state the causes of dead centers and their mastery more explicitly. Physical conditions such as fatigue, loss of sleep, and lowered vitality may mean loss of self-control. Swift, in his experiment on learning Russian, found that “a slight fatigue or any mental disturbance whatever” drove away newly acquired technical skill and caused a relapse into cruder methods. Periods of rest like the Sunday interval register themselves in rises of ability. Depression associated with monotony may not cause plateaus but seems to prolong them. Returning pleasure and confidence prophesy new advances. Strong distractions scatter energy and hinder the learning process. Waning interest, from whatever the cause, is perhaps the surest drag weight to learning and good work. Taking off the keen edge of enthusiasm lessens one’s output. Pleasure in success causes a learner to redouble his efforts. Sense of strain in trying to unlearn bad habits or to cram facts and methods induces depression. A small boy already stuffed to the bursting point and being plied with yet more food said amiably that he “could still chew but couldn’t swallow;” had he been plied with such distasteful stuffs as knowledge or methods he, like us, would have been less amiable. There are limits to our absorptive capacity.

In learning typewriting the effort to spurt is apparently "helpful if not too severe, but overstrain exhausts the learner and hinders his progress by bringing into the focus of consciousness processes that serve him best when in the background." In telegraphy it is intense effort which educates. Each new step costs more than the former. Hence between sixty and seventy-five per cent of beginners become discouraged upon the plateaus of the curve just below the main-line rate (average, tolerable skill). "As a rule ordinary operators will not make the painful effort necessary to become experts."

One of the evidences of mastery in one's profession seems to be a certain independence of influences which strongly affect the beginner. External influences are said to exert a very profound effect upon inexperienced telegraph operators; they suffer from stage fright, while older experts become even more fluent under subjective disturbances like fear and anger. So clear is this fact that Bryan and Harter generalized it into the rule that emotion stimulates the expert, but paralyzes the beginner.

Now what are the bearings upon social work of these psychological experiments? How does cramming or overtraining, or bad training or fatigue, or emotion affect the social worker? Can a social worker get second wind and climb above his plateau? Will a consuming interest or high emulation express itself in better case work? Does jealousy or fear paralyze him? Does a sense of being a misfit hamper one? Do social workers know themselves? Can they answer such simple questions as: Does your job fit you well or does it chafe and pinch and strain like a badly shaped shoe or corset? Does it blister your conscience and spoil your good temper? Will time reduce the stiffness and rubbing, or is the misfit permanent? Can you adapt by growing callous places in your conscience and a permanent kink in your temper? Would vocational guidance and advice have helped you?

These, and many others like them, were the questionings that prompted the wording of my questionnaire. For the answers let me cite replies sent in by social workers. They come from many fields, from organized charity, probation, hospital social service, district nursing, institutional teaching, settlement, child-placing, travelers' aid, boys' club, civic club, and municipal research work. They cover varied periods of service from a few months to forty years. The training represented varies quite as much, ranging from incompleting grammar school to University and Schools of Philanthropy.

The general tone of the returns is highly optimistic. Practically all admit ups and downs, plateaus and dead centers in their work. Their psychology is the psychology of the old plantation refrain: "Sometimes I'se up, sometimes I'se down, sometimes I'se almost level wid de groun'." But there seem to have been few conscious cases of out-and-out misfit. A partial explanation is the fact that most of those who reported went into social work because they liked it, because they were "called to service," or because it was the logical outcome of previous studies; one went so far as to say that it was "innate desire" that impelled to social work. Another explanation is that many of these workers had been at their posts such a short time that the first exaltation and enthusiasm, the wonder of it all, had not yet passed away.

Partly because of this general satisfaction, the attempts to measure personal efficiency and fitness for the work are comparatively rare. Few if any sound objective methods have been tried. Several pleaded so much work or such varied work that no time was left for self-analysis or measurement. One was contented with a general diffused satisfaction as the measure of success. Some experience decreasing worry and friction. One says: "Each year I finish in better shape physically and nervously. Cases seem less complicated and are not so apt

to get on my nerves." Others record gains in poise and confidence. Somewhat more definite is this case: "The test of my efficiency has come through noting the increasing ease with which I carry responsibility, supervise the work of other people, and the ability to keep a large amount of work in order." One suggests this rather illuminating test: "I am now able to leave a greater number of clients in a satisfied mood." Another sets down the increasingly intelligent use of outside organizations as an index of improvement. The ability to get at the core of a problem, to grasp a situation more quickly, to cut down the expenditure of time and energy seem to be the commonest tests. Says one: "I find I spend less time per call, return for information overlooked less frequently, can gain the cordial interest of people more quickly," etc. On the other hand, one worker reports a gain in efficiency because she now spends at least twice and often thrice as much time and energy on cases as she did a year ago, and claims as a result a larger percentage of successful cases. Some have adopted more nearly objective tests. One reports running over the results produced under given circumstances as compared with similar results produced in former years. Several use a "daily log" somewhat like the piece-time schedules of the shop efficiency managers. These, while full of promise, need to be widely extended before they attain full scientific usefulness. One person reports taking a few minutes each day to get a perspective, to sift out the important from the trivial, to coordinate work. Another uses a quarterly test: "Every three months I make a review of work and mental attitude for three things: (1) results; (2) wastage of time and unnecessary acts; (3) mistakes." Another makes a careful analysis at least once a year, and occasional time studies. In still another case which I have been watching for many months with great interest, the worker has been patiently trying a recapitulation and study of twelve years' work

in one district of a large city, using every statistical method possible, with the utmost detachment of mind, in the effort to arrive at a judgment of fitness in terms of concrete accomplishment.

There is abundant evidence that social workers, like other learners and workers, experience periodical losses of efficiency. The causes are multifarious. Most of them seem to proceed from the nature of the worker himself, but some also lie in adverse conditions surrounding the work. Overwork stands easily first, numerically, as a depressive influence. This tallies closely with the experiments of the psychologists. Crowding or cramming begets a feeling of futility. It is only fair to say, however, that very often a sense of being overworked is really only failure to perceive general unfitness for the job or wasteful methods or inadequate training. One writer says frankly on this latter point, "The broader one's training, the more one's work is simplified." Nerve exhaustion, fatigue (cumulative fatigue, one reports), loss of sleep, bad health, variations in vitality and temperamental twists, figure frequently in these analyses. Eye strain is not to be overlooked here any more than in the conduct of delinquent children as a factor in irritability and wasted effort. But worry is, next to overwork, the chief hamper reported; nearly a third of all the returns admit this vampire; worry is a factor in overwork and all its train of evil consequences. But, as with the sense of crowding, worry may be only a symptom of maladaptation. It may come also from the strain of trying to live up to one's idea of his own precious ego. In whatever guise it may appear, worry is always and everywhere *fear*; and fear is the shortest known road to paralysis and death.

Whether one is too young or too old for his job is a difficult and delicate question to answer; but I have found several people who felt that their youth frequently hindered good work. Nobody seemed to feel too old, and

nobody felt it incumbent to propose a definite dead line beyond which a social worker should retire to the shelf. One person suggested, however, that fifty-five might be too old for certain kinds of work with youths; and another that no philanthropist so far had taken thought for "the comfort of worn-out charity workers." Sex seems to be no hamper, largely for the reason that it is usually reckoned with by those responsible for electing workers to their positions. Size, however, is noted by one worker as of importance. She charges that her short stature sometimes loses her the respect of those whom height would impress.

Somewhat more important than these are the adverse effects of lack of coöperation on the part of fellow workers or the community. Some fifteen per cent report this. One writes: "My greatest discouragement comes from a lack of understanding on the part of the general public." Another complains that volunteers take the bit in their teeth and refuse to run in step with trained workers. But on the whole the *esprit de corps* seems to be fairly satisfactory.

The nature of the work itself drains off the energies of many. The recurrent sight and smell of misery, the depressing stories, the monotony of routine, the lack of competent direction and leadership, the sense of spending huge energies for trifling results, the enormous sense of responsibility in dealing with human destinies, are set down as sources of wastage. The most important factor in depression, writes one shrewd observer, "is the result of watching the work of prominent social workers. They seem to put so much energy into their work and yet are thwarted to such a degree that one naturally wonders if it is worth while." Another confesses frankly dropping occasionally into the dumps as the result of feeling that our work tends to prolong bad social conditions. There is also the feeling of futility, closely associated with overwork, which comes from the superficial

slapdash way in which many of us have to turn off our multiform tasks. The bewildering variety of problems which confront the social worker in every field baffles and disheartens particularly the beginner. Usually, however, he develops some specialized talent or enough general experience to enable him to see the common underlying elements in superficial diversities.

I do not find that as a rule the difficulty of a job depresses the vigorous, properly trained worker. Occasionally it discourages, but more frequently it seems to act as a challenge, it unlooses the reserves of pride and grit. As in maternity, so in some social jobs, knowledge that when one says A he must also say B nerves to the highest effort. I recall my own case. A friend who was anxious to induct me to a certain office took me before the Board controlling it. The Board was hospitable, with one exception—a man who was anxious to appoint one of his protégés. He pointed out the difficulties of the job and called attention to my deceptively youthful appearance. Finally, slapping his fat legs for emphasis, he thundered at me, “*Now* do you think you can do this work?” My self-respect and pride were chafed, so I summoned my most leonine expression and shot back at him, “I’ve *got* to do it.” He voted for me at once. Criticism nerves many people apparently to extra effort merely to disprove the critic; it begets the attitude of “I’ll show you;” but it is rather a costly way of securing high effort and large output.

Low salaries and insufficient funds play a small rôle as direct factors in “plateaus”; but they may cut an unsuspectedly large figure indirectly. On the whole I find social workers quite calm on the subject of salaries; they recognize that many of them are absurdly “sweated,” but accept that fact as they would perhaps the whims of climate, *ad majorem gloriam Dei*! Lack of promotion is a minor factor also, though in combination with other factors must react unfavorably. Social workers seem

also to obey the gospel injunction to take no thought for the morrow; for almost without exception they deny any fear of the future. Some write emphatically that there is just as much future for them as they care to make. One says, "I don't care a pin about the future." In default of decisive evidence I put this down to Henley's philosophy in his "Invictis" ("I am the captain of my soul," etc.) rather than to possible impending matrimony! Uncertainty about being able to hold one's job seems to be about equally balanced by the inertia, complacency, and lack of stimulus which come from holding endowed positions.

Very little complaint is registered on the score of community suspicion or hostility. On the whole, relations seem to have been cordial. But several cases to the contrary stand out, with rather sad evidences of retarded work as a result. Both the quantity and quality of one's output is grievously affected when, as one correspondent puts it, you have to waste time playing for confidence and guarding against being "double-crossed," or in overcoming uncertainty about the backing of boards in putting through pieces of work you feel to be vital. A cordial community attitude, on the other hand, "helps a lot," "stimulates for better work," "acts as a spur," is one of the most important elements, say those who have been beneath the harrow.

The effect of one's own home life upon his work is such a delicate and perhaps poignant question that it is almost hopeless to expect much information from a questionnaire. Yet some direct statements appear. One writer says lack of sympathy and coöperation at home cause most of the downs or slumps. Fortunately, the home life of the average social worker is congenial, therefore is an asset rather than a liability; but domestic life marked by jealousy, suspicion, clash of temperament, or unbridled criticism is disastrous to the worker, whether probation officer, C. O. S. secretary, or railway engineer.

I have left till this point the effects of inadequate training. One is astonished at first at the lack of professional training pretty generally reported; but the wonder passes when we realize that professional schools for social work are a development of the last decade. One successful man says that when he was urged to undertake a certain charity job he demurred because he knew nothing about such work. A hopeful sign, said the appointive power; a sign that you are willing to learn and that once in the work you will probably stick to it. This case turned out well, but many others do not. At least twenty per cent of all my returns bewail being handicapped by improper education and training. Some regret the lack of a better fundamental education before special training. This is quite in line with the experience of training schools for social workers and of those who have the oversight of the workers at their posts. The majority of social workers enter their field because they like it, they say. But, as many of them confess, this liking, this interest in people, interest in health, in boys' clubs, in service, in humanity, cannot at once be translated into real ability or effective service. Hence they must blunder along, acquiring methods which must later be unlearned, practicing upon a none too patient public, and only reach a modicum of skill after months or years of hard experience. Do you wonder, then, at serious ups and downs? It is largely because of this lack of specific training before entering a particular field that the social worker's curve follows in its gyrations the curve of the student of telegraphy, shorthand, or chemistry.

Can you wonder, either, that social workers go stale or actually break down? Social work is a dangerous trade because in its very essence it is dealing with social and spiritual maladjustment, and by the very complexity of those maladjustments taxes our every resource of good temper, faith, sympathy, and nicety of judgment. There

is little relief from the daily pressure. This is brought out by repeated testimony to the fact that too much variety rather than too much routine tends to baffle and wear the worker down. The danger signals of impending breakdown in one's spiritual fitness for his job are impatience, touchiness, hypersensitiveness, physical pain, shortage in ideas, lack of interest or joy in the work, and abnormal flashes of bad temper. The effects are easily recognizable: inability to think quickly or clearly, "thinking incoherently and skipping from one job to another," feeling that one is "cumbered with much serving and spending time on unimportant things," superficiality, trying to find the easiest way, incapacity for prolonged effort, wasting time in thinking without doing, sense of uncertain grasp, "disgust with the job and a desire to change," loss of resourcefulness, spontaneity and power to inspire, indecision, hysteria, and temporary crippling of sound judgment.

IV

This whole study would be an unprofitable tale if it did not suggest how we may clamber out of the sloughs of despond and scale the heights beyond our present plateaus. That we can is clear from experience. Sometimes ups seem to follow downs almost as naturally as hills match vales. One correspondent shrewdly explains this as coming from "a sense of exhilaration about landing safe, or even landing at all." Reaction through sheer gratitude, like convalescence! Another proposes harder work as the cure for a grouch, but wisely adds that perhaps "taking it out on others" is what he really has in mind. But most of us are not of such resilient natures that our curves of energy rise merely from weathering hard times. The uses of adversity are by no means always sweet; frequently they deaden and brutalize. Hence remedies must be invoked to restore our mental and spiritual equilibrium. A good night's rest, sleep,

food and exercise, going away from people who try one's nerves, cutting off outside distractions, retiring from the world, getting out of doors, are common resources. President John L. Finley has long followed the custom of saying to faculties and students at vacation partings, "read a new book, make a new friend, take a long walk." Golden advice; there is no better tripod upon which to base your personal and social health.

Good books are like alpenstocks in our efforts to climb. Most social workers cling to *The Survey* as their chief professional guide, supplemented by the technical journals covering their special fields, conference reports, and the like. For general reading they follow the standard magazines, with considerable emphasis upon the *Atlantic Monthly* and *New Republic*. The *Ladies Home Journal* is read by at least one worker, "to keep human." *De gustibus non!* Dr. Cabot, Henderson, Jane Addams, Stevenson, Emerson, Kipling, books on efficiency, and detective stories share honors with the Bible. Those few cases where no time for reading was reported were just the cases in which depression seemed most deep-seated and chronic.

The wisdom of vacations with pay seems beyond question. The gain to the worker redounds to his organization. To many of my correspondents, apparently, the idea of a sabbatical seemed so new that they were at sea. Some, however, announced positively that a year out of every seven or eight, spent in reëducation, would be enormously profitable. If it is true, as one veteran suggests, that in every new decade we must unlearn the teachings and methods of the preceding decade, it would be the part of wisdom to plan for such periods of renewal and reapprenticing as part of our schemes of organized social effort.

My final point has to do with special sources of help. Conferences are pretty generally approved; meetings with fellow social workers, likewise; though one writer

rather snappishly declared that social workers have no new ideas, as they simply repeat what they have read in books. The backing of loyal friends is a universal source of strength. Optimism seems to be a desirable asset in such friends. Encouragement by superiors and good teamwork with one's fellows loom large. Sympathy of domestic mates is frequently noted. Meeting with resourceful individuals and strong personalities is usually helpful; but one writes, "Strong personalities make me tired." Evidently a legitimate protest against having to coddle or placate or hobnob with some notable tyrant, some bloodsucker, some personality that demands instead of giving or inspiring. Some curious, abnormal individuals get their greatest help from talking shop, from making speeches—God save the mark! More derive help from hearing others speak, from preachers who think, from great lecturers, from University Extension courses. Others draw courage and fire from the biographies of the great veterans in social work. One speaks of the value of self-communion through a personal diary. Another of growing an imagination. Still another of the stimulus from personal ambition for leadership. The magnitude of the problem stirs up some strong souls; one writes: "The one hundred million people in the United States—folks—are my greatest inspiration and give me courage for the future."

The desire to plumb the very depths of things may also constitute inspiration. To me, writes a young man, "the most inspiring thing is that there is a wonderfully increasing tendency to get to the bottom of social work and put it on a systematic and businesslike basis. . . ." The assurance of doing good work also helps—"the conviction that one is doing real work and being paid for it," as one phrases it. Belief in humanity and confidence in God's love illuminate some dark hours. Indeed religion very commonly appears as the energizing factor in recuperation or progress. A large proportion of social

workers testify to this fact. Some speak specially of the benefits of Christian Science; others of prayer. Some discriminate carefully between their religion and the church; my own personal religion, not my church, says one. Another observes: "It is difficult to state the effect of religion at this time. The ordinary church depresses me and I have come to feel that the church which ought to have 'being' as its motto has the commercial idea of 'acquiring' very much in the forefront. I do not think that social workers any more than other men can afford to disregard religion, but I do not see how they can be influenced very much by tradition and creed." This person's demand for a less other-worldly type of religion is echoed by another: "Religion should be playing an important positive part, but is playing only a negative one, due in part to failure to find any organized expression of religion which seems to fill the need within one. There is, of course, the belief that things are really growing better and the hope that one may have a share in making this old world a better place for some to live in." Religion in this and other cases would seem to offer the emotional background for an attempt to believe in the possibility of progress, of destiny controlled for progressive social amelioration.

Several general hints suggest themselves by way of summarizing the facts in this study.

Time ought to be definitely allowed in a worker's schedule for periodically checking up. Disinterested experts should be called in occasionally as auditors are in business offices, or municipal research experts in public affairs, or as the Life Extension Institute proposes for its members, for a sympathetic taking stock of our technical and spiritual resources. Teachers of methods of social work should include ways of self-testing and analysis which can be used as barometers and help in forestalling tragic misfits. No social worker should be considered as fitted for his job until he has achieved a phil-

osophy of life which will work in time of strain and crisis. The cause of social reconstruction, as we all know, is not seldom impeded by jangling personalities. Spiritual dependents and defectives may be found in offices as well as in tenement houses. Just as sound industrial life requires provision for periodic reëducation of its workers if they are to keep up with the advance of mechanical and business technique, so professional life, and above all the profession of social work, must provide for periodical "retreats" for the refreshing of its workers. Scientific social work cannot be satisfied with a few months of initial professional training if it would avoid community or personal ruts and dead-centering. The spirit of science demands that the worker shall not only add constantly to his own equipment but that he shall share with his fellows for the enlargement of the whole. Only by prodigality in providing for and encouraging the ceaseless upbuilding of its social workers in health, culture, and mental poise can a community secure that economy of effort which will make sure that if we must have plateaus of staleness and valleys of humiliation, at least they will recur less often and at a constantly higher and higher level.

CHAPTER VII

THE LABOR TURNOVER IN SOCIAL AGENCIES

The scientific spirit, as we have seen, is the true determinant of the social worker's attitude toward his profession and his clients. It offers, moreover, an approach to the problem of efficiency, whether from the standpoint of a welfare organization or of its personnel. We have already analyzed some of the factors in the individual's going stale; and we hinted broadly at some of the reasons which conspire to dead-center an organization. It remains to show by a single concrete example how the methods of science may perhaps aid in stabilizing the administration of social work.

One of the most annoying and persistent problems common to both industry and social work is the constant shifting of the staff. Mr. Carnegie once said that if his plant burned down it could be rebuilt without delay and with no appreciable loss; but if his organization were disrupted his whole business of producing steel would be crippled if not utterly destroyed. This is the nightmare of the "general strike" or of any local strike or lockout. Employers have sensed this clearly enough for a century and took precautions early against such crises by attempting to have them branded as conspiracies and by enlisting police and military forces to prevent or suppress them. But they were much slower to recognize the losses entailed by the anarchy of attrition; that is, by the ceaseless round of hiring and firing. This they not only considered inevitable, but even aided and abetted by holding desperately to the unlimited right to discharge and by conniving to maintain a reserve pool of surplus labor.

Even "scientific management" itself was brought rather belatedly to recognize the wastage involved in such incessant shifting in the personnel of production. Time studies and the elimination of needless motions were right enough so far as they went, but they could not stop the leakage incurred by having to teach a new gang every morning the lessons which the gang the day before had barely learned.

But within the past five years two new ideas have crept into scientific management. First, the perception that a worker is something more than a nameless wheel in the organization of an industrial plant; that industry cannot be separated from other social concerns; that employees have homes and other interests besides the interest in a particular job. Second, the idea of the employment manager, who will unite psychology, social vision, business acumen, and common sense in the attempt to apply science to the process of filling jobs. Already employment management has acquired almost the dignity of a profession; certainly it is to be recognized as a skilled vocation, and will continue to be necessary in some form or other, no matter how far the present tide of affairs sweeps us away in the direction of a democratic or even socialistic organization of industry.

But these employment managers working individually and through their conferences have done much more than serve their employers by adding to his profits or the workers by stabilizing their earnings. They have rendered a distinct service to both theoretical and applied social science by demonstrating in concrete figures the losses through misplacement, casual displacement, and no less casual replacement of men in jobs. Mr. M. W. Alexander of the General Electric Company made one of the pioneer studies of this problem. He covered, for the year 1912, the hiring and firing of twelve factories employing an average of 40,622 men and women. To maintain this average, "42,571 persons were engaged

during the year, whereas the engagement of only 20,540 could be defended on even liberal grounds. Therefore 22,031 persons were hired above the apparently necessary requirements." Now what did this cost? By a detailed analysis he figured that the average cost of hiring and firing was \$53.92 for each new employee and \$16 for each rehired employee—a total of nearly one million dollars. The pay roll of these twelve factories totaled some \$29,000,000; nearly $3\frac{1}{2}$ per cent therefore of this amount represented faulty employment methods. Moreover if the experience of these twelve concerns were a fair statistical sample of the state of manufacturing industries the country over the annual national losses would run up to the amazing figure of \$172,000,000 based on the number of employees, \$187,000,000 based on capitalization, and \$248,000,000 based on total sales. And these figures cover only such items of cost to the employer as instruction, wear and tear, spoiled work, reduction in output, and accidents. They tell nothing of the still greater losses to the employees themselves.

But are these figures typical? In the old days before the Ford Motor Company introduced scientific employment methods its experience was even worse. From October, 1912, to October, 1913, it hired 54,000 men to keep up an average force of 13,000—a 400 per cent turnover. Other concerns report a turnover of from 125 to 240 per cent. An analysis of fifty-seven Detroit plants revealed an average turnover of 252 per cent in 1916. On the Great Lakes the Lake Carriers' Association found in 1913 that when the normal number required to man completely their fleet was 10,476 they actually hired 52,094, a turnover of about 400 per cent. Three years later this figure had jumped to more than 500 per cent. I am unable to find anybody who can tell me what should be considered a normal turnover, but some employment managers talk as if zero were the normal objective to be attained.

What is the bearing of all this upon social work? Without attempting to assimilate too closely the experiences, methods, and standards of modern business to those of organized social work, it looked like a fertile field of inquiry to attempt a study of how staff turnover affects social agencies. In making it there were no blazed trails to follow, save the few hints from the field of industry. A detailed questionnaire prepared with great care and submitted to the executives of various social agencies (including the American Association for Organizing Charity) was sent to all of the large and one hundred and forty of the smaller relief societies in the United States and Canada. All but three of the larger and seventy-two of the smaller societies returned replies usable in whole or in part. Only thirteen of the forty-two children's agencies responded; and of this number so few were in manageable form that their effect upon the whole study was found to be slight. A still smaller number of settlements responded; hence their experience is quite negligible for the conclusions as a whole.

Of all the cities responding thirty-nine reported the size of their staff and the turnover for the five years ending in the spring of 1917 in such shape that comparisons could be made. The percentage of turnover for the seventeen cities with a staff of ten persons (exclusive of purely clerical workers) or over ranged from 47 to 292, with an average for the whole group of 144. (Table I.) The only serious omissions from this group are Chicago, St. Louis, and San Francisco, but there is no reason to believe that their experience differs sufficiently from the seventeen other large cities to change their average materially.¹

¹ As this volume was going through the press, the United Charities of Chicago reported the turnover for its field workers (superintendents, assistant superintendents, visitors, visiting housekeepers, stenographers, clerks and directors of volunteers) as 53.3 per cent for 1916-17; 68.6 per cent for 1917-18; and 43 per cent for the first nine months of 1918-19.

TABLE I

TOTAL TURNOVER BY CITIES—FIVE-YEAR PERIOD

I. SEVENTEEN CITIES WITH STAFF OF TEN OR OVER

<i>City</i>	<i>Total Turnover</i>	<i>Total Staff</i>	<i>Per cent Turnover</i>
Atlanta	17	10	170
Baltimore	45	33	136
Boston	25 ¹	26	96
Brooklyn	113	105	108
Buffalo	30	20	150
Chicago-Jewish Aid	28	18	156
Cincinnati	20	27	74
Cleveland	57	49	116
Columbus	27	13	208
Detroit	37	23	161
Milwaukee	11	14	79
Minneapolis	52	25	208
Montreal	7	15	47
New York	146	50	292
Philadelphia	58	44	132
Pittsburgh	25 ²	22 ²	114
Washington	30	12	250
TOTALS	728	506	144

Similar returns from twelve smaller cities with relief agencies having a staff of less than ten persons revealed a more striking range of turnover. From a minimum of 25 per cent the figures soared to 300 per cent, with an average of 98 per cent for the whole group. (Table II.)

¹ Boston gives no figures for changes in group employed less than two years.

² Estimated.

Several interesting facts cropped out in the process of analyzing these returns. In the first place some agencies had never thought of keeping such a check upon the vicissitudes of their staff. One executive wrote that if we could renew the request for figures five years hence he would have them, since the very inquiry had challenged him to more careful observation. Several others made copies of their returns for their own guidance as a sort of balance sheet. In certain agencies the turnover had been so rapid among the higher executives that nobody had the facts from personal experience for even two years back, to say nothing of a five-year period. In one or two cases of smaller New England relief societies there had been no change of staff in from ten to twenty-five years!

Speaking by and large, upon the basis of these figures,

the turnover in some social agencies is much lower, in others rather higher than the experience of certain industrial plants. But on the whole the advantage is distinctly with the social agencies, particularly if, in making the comparison, we remember that our returns are for a five-year period, while the figures from industry represent the annual rate. This is what might have been expected, since we are dealing with a semiprofessional class at least, by contrast with a very large percentage of unskilled or only partially skilled labor in the industries quoted.

Most of the agencies reporting did not pretend to know definitely what the proper or normal percentage of turnover should be; they had no exact figures nor any convincing experience to base a judgment upon. Twenty-five, however, hazarded answers more or less tentatively. They begin with one whose guess is a counsel of perfection: there should be no turnover! The rest shade off in the direction of actualities. Fifteen say 10 to 20 per cent is a proper annual turnover; four say 25; the remainder from 30 to 40.

Since the bare figures of total turnover tell us nothing of how differences in professional rank or attainment affect tenure of office and stability of staff, the next step in our problem is to analyze the total five-year turnover by ranks and by years of service. The reports of twenty-seven cities with 770 workers are available for this comparison. (Table III.) It required some interpretation of staff titles to reduce the various returns to some common denomination. For example, it was necessary to make a separate pigeonhole entitled "special secretary" to take care of such diversities as French secretary, church secretary, anti-tuberculosis secretary. But on the whole the reports from these twenty-seven cities were in such shape as to be readily comparable, thanks to a fair standardization of office organization.

Even a superficial glance at Table III shows at least

two critical points which substantiate generally accepted experience. First, the greatest turnover (both absolute and relative) is in the group of visitors or district agents—that is, among the newer recruits; and this shift is in inverse ratio to length of service. Second, the next greatest ratio of change occurred among district secretaries, but with the time element transposed, for the largest percentage of turnover was among those of longest service. The immediate presumption is of course that they were largely promotions to higher executive positions. But for many reasons the most significant feature of this whole table is the distribution of percentages in the totals. *Nearly half the changes occurred within less than a year after employment!* Two-thirds within two years; and three-quarters within three years. As we shall discover later many of these changes are due to maladjustments of various sorts—lack of training, general unfitness, domestic difficulties, and the like.

Here again the critical points are the district secretaries and the visitors, and as before with the time ratios reversed. For while nearly half the district secretaries have served four years or more, and two-thirds more than three years, one-third of the visitors have been on the staff less than a year, over sixty per cent less than two years, and four-fifths less than three years. This appears much more clearly in Table V and in the graph based upon it. The rapid descent of the solid line indicates the relative stability of the higher ranks on the staff, while the giddy soaring of the dotted line tells a mute story of constantly "breaking in" new and inexperienced workers.

GRAPH ILLUSTRATING TABLE V

The attempt to work out some valid idea of the average length of service proved unsuccessful for several reasons, but principally through the fact that most of the smaller societies were unable to compute any average which would mean anything. It is true that thirty-two agencies did venture to suggest an average, which in two-thirds of the cases ranged between two and four years. Only two ran over four years. The period of service showed such wide ranges—from a few days to as high as ten, twenty-five, and even thirty-nine years—that any attempt to scramble such figures and call it an average would have been merely ludicrous. It is significant that a good many executives who filled out the returns had been on the job such a short time that they could not give the ancient history of their organizations. One man wrote that he was the third secretary in three years. Again, other agencies were too young to have any significant figures yet. On the other hand, some cities like Worcester, Massachusetts, change their social agencies very slowly. The first secretary of the Associated Charities there stayed four years. Her successor is still at work after twenty-two years of service. She writes that “all the social workers in Worcester, public and private, *stay!*” By contrast one Eastern executive cleaves to the opinion that “five years seems a fair period of service. In exceptional cases only should long periods of service be desirable.” Here, of course, we run into a stone wall, and can only adjourn scientific hope until some sure method is worked out for diagnosing dead center in a social agency. Such a diagnosis will tell us how long one should stay with a social agency before wearing out his welcome.

An attempt was made to discover whether there is any difference in the proportion of turnover in public as compared with private agencies. The general burden of opinion inclines toward the idea that there is no difference. However, a considerable number of comments indicate a

belief that there are relatively more changes in private agencies than in public. Likewise, concerning the endowed as compared with the unendowed agency, what few clear opinions were secured tended toward the general conclusion that the endowed agencies are the more stable. It is curious to find that in a good many instances the same reason is given why endowed and public agencies are more stable. The reason is not flattering, since it is usually a suggestion that these agencies are more wooden, antiquated, routineer, and involved in politics. The evidence here is so conflicting as to be in no sense authoritative. It simply reveals curious little prejudices and echoes of unpleasant local situations.

The question of periodicity forms another interesting angle of approach to the whole problem. Is there an open and a closed season for social workers? Is social work a seasonal industry? Out of thirty agencies reporting their experience seventeen found their changes in staff rather uniform throughout the year; thirteen reported seasonal or periodic shifts. Some misunderstood the question and found neither uniform nor seasonal changes! And many had no reliable data or were too small or too young to judge. Several of the larger agencies reported most changes between spring and the end of the summer. This is probably, as New York's experience suggests, because of the easing down of the winter rush. The New York Charity Organization Society employed 57 per cent of its one-year workers during the four winter months.

In attempting to come at closer grips with the reasons for turnover, two classes were set up; namely, voluntary changes and dismissals for cause. We have the experience of twenty-nine cities involving 603 workers as a basis for analyzing the reasons for voluntary changes. (Table VI.) One out of every eight went because of death or old age or physical disability. About the same proportion married. Nearly forty per cent resigned to

TABLE VI

take positions offering more attractive salary, higher rank, or better chances for promotion. The most significant item is, however, the hint of maladjustment. If we may interpret leaving social work to enter other pursuits as a question of lack of fitness for social work, and add these cases to those where unfitness is frankly confessed, we roll up a total of fifteen per cent of misfits. Not all are misfits, however. One very poignant letter

¹ Includes returns from some agencies whose figures were inconclusive for Tables III and IV.

explaining why the questionnaire had not been acknowledged earlier stated that the writer had broken down from overwork and closed as follows: "The study you will make from data collected will be most interesting. It is a forward step which I indorse. I really am alive to the vital issues of the day along every branch of sociological endeavor, but it is against human nature for me to have to do two people's work all the time and three parts of the time at the heaviest season of each year. Am seriously considering giving up social work and seeking some other means of livelihood." At this point the question of vocational guidance, or misguidance, emerges; and the emphasis is heightened if we add to the number of misfits those who for various reasons left to secure more training. Domestic complications, such as objection of parents or sickness in the family, accounted for a good many changes. Finally into the pigeonhole "miscellaneous reasons" are stowed away such causes as travel, prolonged holiday, "retired to a ranch," "released to another organization which needed worker more" (camouflage or the millennium?) "need change of altitude," left to become a nun, or foreign missionary, or study for the ministry. This is by no means an unwholesome or dispiriting story. The desire for advancement is perfectly healthy and should be encouraged and met so far as the resources of an organization are concerned. Loyalty to the organization or to its chief should never be shouted so loud that the voice breaks, especially if the shouting is unaccompanied by some more substantial argument. The fifteen to twenty per cent of misfits, to a greater or less degree, remain a stumbling-block which will be in part explained later after examining the reasons for dismissals from the staff.

The best approach to the figures of dismissals for cause is perhaps through an analysis of the length of service in such cases. Here we have the experience of twenty-five cities involving 248 cases. Table VII shows that eighty per cent of them had been on the staff less than two years. The immediate presumption is that most of these were seasonal "fill-ins" or inexperienced workers who soon proved to be misfits. This presumption is pretty well justified by the analysis of the specific reasons for dismissal (Table VIII.) One out of every six apparently was discharged automatically after finishing a predetermined period or job. Recall that many agencies add extra workers for the winter rush and drop them in the late spring. Staff reorganization was responsible for a few changes, but it is an open secret that reorganization is frequently a means of getting rid of deadwood when no other method avails. Far more serious than either of these is the factor of incapacity or maladjustment, however denominated. Considerably over half of all the cases come under this heading. Not all such cases are chargeable to unwise vocational steering or bad judgment on the part of executives; but either those executives or the agencies responsible for training the misfits, or both, should see to it that the figures of ten per cent for improper training and another ten per cent for inability to do teamwork are materially reduced.

Just how this responsibility for poor judgment is to be divided may appear by inquiring who hires and what methods of recruiting are used. Apparently in nearly all the smaller societies the board of directors hires all the staff. In the larger agencies the usual procedure is for the board to appoint an executive secretary who selects the rest of the staff. In thirty out of seventy-two cases the secretary, superintendent, or other chief executive did the hiring. In twenty-six cases the board hired all with or without recommendation by the executive. In fifteen others the executive recruited his staff with ap-

proval or advice of the board or a special board committee. In a few cases the heads of departments assumed this responsibility.

The methods of recruiting were just about as varied and uncoördinated as those of the munition or ship plants in the early days of the war. Some agencies frankly acknowledged the use of all methods, some confessed no fixed method. Twenty-three depended upon chance applications. Personal search, "scouting" at conferences, personal acquaintance, or special tips from friends netted a good many. Schools of Philanthropy were credited as the best source by twenty-three agencies; the American Association for Organizing Charity came next with nine; the Intercollegiate Bureau with eight; college placement bureaus and university contacts yielded seven. Advertising, training classes, and application waiting lists brought in a few more. Here we encounter one of the weak spots in organized social work. It can be strengthened in at least two ways: by standardizing gradually the professional education of social workers, and by developing sound placement bureaus on lines suggested by the National Social Workers' Exchange.

There can be no doubt that many changes, particularly in the larger well-established relief agencies, result from the practice of beginners using them as training schools or stepping-stones. Thirty-five out of fifty-four have had this experience. This number, with only three or four exceptions, includes every large society. Boston answers, yes, decidedly, to a question on this point: "the chief reason for the many changes in our staff." Minneapolis modestly says "yes to a certain extent—at least we like to believe so!" Pittsburgh thinks it is to be expected and desired. New York agrees it is unavoidable, but would not encourage people to join its staff with that understanding, except as volunteers. Cleveland finds it less true now than in the past, presumably because the community has developed other means for training.

Other cities hope that they are entering a period when such a state of affairs will obtain. A side light on the migration of social workers is thrown by the report that the workers trained by some of the smaller agencies wander off to the big cities, while such a city as Brooklyn finds that its district secretaries leave for positions of greater responsibility in smaller towns. To a certain extent this tendency is offset by proper increases in salary.

But in spite of the general recognition that better salaries tend to stabilize a working staff a good many charitable agencies still pay, or are forced by circumstances to pay, low salaries even at the risk of losing their workers as soon as they become really efficient. The experience of the larger agencies is about equally divided on this point. Some say they are not conscious of any such reasoned practice; others admit it as an unfortunate fact in the past; still others state definitely that this has been the regular policy of their boards. It is a situation closely resembling "sweating" and seems particularly marked in a large majority of smaller agencies.

This leads to the whole question of salary schedules and their effect upon turnover. In general we may say that most larger agencies have some sort of a progressive salary scheme or are trying to develop one. By contrast most of the smaller societies have none at all or else their progression is so limited as to be ineffective. Various modifications of the method crop out. One city uses a progressive scale for the first twenty months of service, then resorts to "promotion on merit." Another scales up to a maximum of \$70, but promotes slowly after that. Several use the graduated method for the apprenticeship stage of visitors in training only, and apparently use the method of higgling in the market thereafter. There seems to be no doubt that other things being equal where such a recognized possibility of salary

increases is in practice it tends to hold the staff together, at least for from two to five years. Here and there some doubt is expressed as to its effect, but in such cases the trouble would seem to lie not in the principle of progression but in the low standard of salaries in general which makes it difficult to meet competition. That these cases are exceptional may be inferred from the mournful plaint of the secretary of a good-sized Western society who deplores the breakdown of her staff because her directors do not see the need for such a method since business concerns are not run on that basis. Another exception proves the rule—and more: a Middle-West agency reports that its workers stay on in spite of low salaries. Evidently the good old days of piety, renunciation, chastity, and good works are not utterly swallowed up in the new salaried, scientific charity!

The question finally simmers down to a determination of what is a decent living wage for a social worker. By what standard shall it be measured? It seemed to be not unreasonable at least to inquire how salaries in relief agencies compared with those prevailing for elementary or high-school teachers. Out of sixty agencies replying to this question twenty-two claim that their salaries compare very favorably with those of teachers; eighteen find them less, particularly for beginners; five consider them fairly comparable; seven are on a par with elementary but not high schools. A few details will clothe these statistical bones with flesh. In Boston salaries of social workers compare more favorably with those of teachers after the period of apprenticeship is over. In Pittsburgh, salaries are lower at first, but after three years are about equal to elementary-school salaries. In Minneapolis they are apparently bigger at first, but the maximum is lower except for executive positions. In Brooklyn, Des Moines, and Sioux City, for example, they are considerably lower; in Cambridge, 10 to 15 per cent lower except for general secretary. Hamilton, Ohio, pays the general

secretary less than a high-school teacher, and visitors less than elementary teachers. In Dallas, Texas, visitors' salaries compare with those of elementary teachers, but the superintendent or general secretary is comparable with only the lowest high-school salary. In several cities in different parts of the country the executive secretary ranks about equal with or above the high-school teacher; but the visitors seem to offset this gain by running considerably lower than elementary school teachers. On the whole, this is not a showing distinctly flattering to social work. We are apparently still faced here with a survival of mediæval thought which confided so large a part of charity and good works to the care of unpaid monastic orders. But the increased demand for social workers since the outbreak of the war is already registering its benevolent effect in a rise of the salary schedule. It is to be hoped that this advantage can be carried over into times of peace, for there is no doubt that it would have a marked effect upon the stability of social organizations.

It is a matter of common observation in the business world that competition for workers sometimes degenerates into shameless stealing of trusted employees. The question of whether a similar situation held in the field of social work was put to the various agencies concerned. In the vast majority of cases a flat "No" came as the reply. Only a very few cases had suffered the contrary experience. Some of the executives replying to this question stated that sometimes they felt personal resentment, but that the ethics of these practices had not been established and they were inclined to accept the situation philosophically. Apparently, deliberate piracy of this sort has very little to do with the general average of turnover.

There is no doubt that one of the results of rapid turnover in social agencies is the enforced promotion of unprepared and inexperienced workers to positions of

responsibility. About one-third of some forty agencies reporting have been the victim of such necessity. This is particularly true of the larger agencies. Some of them say frankly that they have to do it altogether too frequently. For example, one says flatly that "Every promotion the last two and one-half years has been too soon for the work or the worker. One resulted disastrously." Only one agency reports such a promotion as a brilliant success and implies that it was a great gamble. Most of the societies reporting that they had not suffered in this way belong to the group whose staffs are so small that they are not arranged upon a hieratic basis. It is quite evident that one great source of trouble is the fact that workers move about so rapidly that they do not thoroughly master the elementary stages of their jobs in such a way as to become good timber for promotion to the higher ranks.

The question arises as to what effect the training or lack of training of social workers has upon their mobility. An effort was made, therefore, to ascertain what type of training workers actually employed by relief agencies had. Table IX on page 154 shows the percentages of the staff of seventy-two relief agencies having specialized types of training.

TABLE IX

PERCENTAGES OF STAFFS OF 72 RELIEF AGENCIES WITH SPECIFIED TYPES OF TRAINING

<i>Type of training</i>	<i>Seventeen larger agencies</i>	<i>Fifty-five smaller agencies</i>
College	46.5	40.9
Full College	43.1	38.2
Part College or Normal	2.8	2.0
Post Graduate	0.6	0.7
School of Philanthropy	18.2	24.
Trained by Organization	33.0	43.3
Nurse's Training	12.0	7.0
Special Training in Russell Sage Foundation, Etc.	4.5	2.4
No Special Training	15.2	10.0
Ambiguous	0.6	6.0

These have been divided into the larger agencies having a staff of ten or over, and smaller agencies having a staff of less than ten. Nearly half of the workers in the larger agencies have had either part or full college training, and two-fifths of the workers in the smaller agencies were similarly equipped. Schools of Philanthropy contributed a slightly larger share to the smaller agencies. The latter also apparently depended more upon training by the organization itself than did the larger agencies. It is somewhat surprising to find that a larger proportion of the big agencies utilize people without any special training. This should not be unduly emphasized, however, since in dealing with relatively small numbers a statistical exaggeration of a slight difference could easily be made. It is perfectly apparent from some of these figures that social work on the whole is entitled to the claim of professional standards since at least two-thirds of all the workers employed by all of the seventy-two agen-

cies had either academic or professional training with, in some cases, specialized training in addition. In this connection it is worthy of note that a good many of the agencies believe that to increase the professionalizing of social work will reduce the turnover. In all justice it must be said, however, that a nearly equal number are of the opinion that such a professionalizing will not only fail to cut down the turnover but will actually increase it.

A clearer idea of what is involved in rapid turnover may be derived from an analysis of how long it takes to train or break in a new worker. The length of time required to train a relief worker is apparently from three months to a lifetime, if we may judge from what the relief agencies report. Out of fifty-two agencies reporting, six figured this time at from less than six months to a year; nineteen from one year to two years; seven from two years to three years; two from one to three years; six could make no estimate, and one suggested that a lifetime would be none too long for his particular kind of work. It is understood that in most of these returns the unit for training is a case visitor. Naturally, the question is not an easy one to answer offhand. One agency, for instance, called it an impossible question, as so much depends upon the individual. Of course it does, and it also depends upon the individual who is supervising the training. Nevertheless, speaking by and large, certain general principles of practice emerged. From long experience, some of the older agencies have crystallized this experience fairly definitely. Philadelphia, for example, considers a worker in training for one year, with a further year before becoming a superintendent. Cleveland has a training of seven months technically, but this really means from two to three years. In New York the practice varies, but it is not unusual for a visitor to be promoted to an assistant district secretary after one year of training and to a district secretaryship in two years. Not all of the agencies have reduced their practice to any such clear-cut basis.

Some of them qualify their requirement of six months' training by adding the phrase, "if the worker has natural aptitude." Some depend upon a primary try-out period of three months as the minimum time necessary to prove a worker's fitness. When one considers that some agencies would require an office training of a year or so after college and school of philanthropy courses, while others would require no more from beginners with no previous background of social or college training, it is pretty evident that the process of standardization has not been carried very far yet in this particular or else that the exigencies of local community life vary enormously.

The period of training required of most beginners in a relief agency figures largely in an estimate of what it really costs to break in a new worker. Industry figures this item at from \$40 to \$200, and even as high as \$1,000 for a foreman. The problem has never been worked out so clearly for social agencies, since a cost-accounting system is more difficult to operate in philanthropic agencies than in a manufacturing plant. However, a few suggestions have been gathered bearing upon this problem. Out of thirty-three agencies reporting two figured the cost of breaking in a new worker at about \$50; one at from \$50 to just under \$100; five from \$100 to \$300; three from \$300 to \$500; one at \$600; one at \$1,000; seventeen had never figured it out, and three were inclined to believe that the worker really pays his way from the beginning. The agencies sometimes figure that if a worker sticks or if a volunteer makes good the cost will be eventually offset by service. This may be true if salaries are low. Let me add a few illustrations to the bare figures. Springfield (Illinois) and Harrisburg figure that the agencies lose practically the first three months' salary of a new worker; York raises this to a year's salary; Lansing puts it at \$50 per month for the first four months; Fort Worth, about two months' salary; Lincoln, two months of partially handicapped work in the office; Washington, \$200 as a

moderate estimate, \$100 for training and \$100 for wasted relief; Winnipeg has no definite figures but recognizes the waste in unnecessary relief; Cleveland, Buffalo, Cambridge, and other societies have never reduced the problem to terms of money but know that it costs much in time, nervous energy, poor case work, lack of coöperation, and the very valuable time of supervisors. Duluth exhibits a rare spirit of resignation by claiming that it costs nothing to break in a new worker because other workers put in overtime! This, of course, is simply sidestepping the issue, because somebody must eventually pay the bill. The more scientific view is the one suggested already, that if a worker stays with his job long enough the employer may recoup the initial loss by adjusting the scale of salaries to cover the waste. At any event it is evident enough that the rapid turnover is even more vital to a social agency than to a business house because of the peculiar nature of social work. Good will is a precious asset in business, but in a social agency one must consider not only the attitude of clients but of the contributing and of the critical public as well. Whatever tends to stretch unduly or to snap the threads of good will which bind an agency to its public must be reckoned a serious loss. And even if it cannot be stated in definite terms on a balance sheet, there is always a certain loss of morale involved in an unstable staff. Right here is one of the sources of weakness with which many executives are charged; namely, that they become so involved in their case work and office routine as to lose sight of any contact with the public. By frank confession and by common experience we know that much of the time and energy of executives goes into petty adjustments of mistakes caused by new workers which ought to be saved for the wider education of the public. Anything which will reduce this wear and tear upon the executive and stabilize the staff should make of such an agency a much more effective community educational resource.

Finally, we come to the question of means suggested for cutting down turnover. By an overwhelming majority, higher salaries are set down as the means most likely to accomplish stability; not only higher salaries, but better adjusted salaries, standardized salaries, and perhaps a somewhat nearer equalization in the salaries of subordinates and higher executives. Among a great miscellany of suggestions, the following stand out: better professional preparation; reduced size of districts; better general working conditions; more free time for workers to study their work; more attention to systematic training; stricter requirements for employment; greater opportunity for individual development and encouragement to originality; dignifying the job by wider education in the meaning of social work; reducing overwork particularly during the winter rush; cultivating loyalty to the organization; recognizing the value of continued service; making yearly contracts.

In all this list of suggestions there is not a word in favor of scientific testing to determine an applicant's fitness for social work. Is it not time at least to begin experimenting with some such psychological tests as the University of Minnesota uses for prospective entrants into its medical school? Surely social work has achieved sufficient definiteness of content and method to be capable of formulation into principles which could be translated into the categories of a set of psychological tests.

In running through the mass of detailed suggestions one must not lose sight of the fundamental fact that there are two desirable objectives in the organization of a staff: first, efficiency, and second, justice. If a staff is dead-centered it needs the acid of disintegration instead of the glue of salaries to hold it together. And on the second point, we are in absolute agreement with the superintendent of the New York Charity Organization Society who urges that it is better not to reduce the

turnover if that would involve decreasing earned promotions.

In reviewing this brief study one cannot escape the conviction first and last that whatever wastage in social work results from the shifting sands of staff organization is traceable in large part to a lack of the real scientific spirit. It is either improper or insufficient training; that is, lack of scientific preparation. Or it is misplacement, which again results from an unhappy combination of lack of scientific acumen and lack of common sense. Most of the faults of personality which brought about dismissal were open violations of the social workers' code as analyzed in our study of the scientific spirit. Finally there is a certain myopia of outlook which renders the lives of some workers sterile and destroys whatever solid fruit their agencies might have been able to produce. A singularly clear and open-minded letter came to me on this point from an Associated Charities secretary. She writes: "I have come to feel within the last two years that one reason for the lack of permanency in the staffs of Charity Organization Societies may be a certain unrest and impatience for results among the workers themselves. When workers learn to take the long view which looks for permanent results only in terms of years, and to form the habit of taking root, for better or worse, in one community and identifying themselves with the life of that community, we will probably for the first time realize the possibilities of our profession." She is right; but perhaps it is not mere crazy optimism which bids us believe that when social work shall have attained the full status of a profession and accepted all the responsibilities laid upon a profession as distinct from a trade, a really scientific attitude will mark the mind of the social worker, which will confer poise upon the individual worker, stability upon his organization, and long range, illuminated, well-articulated types of service upon our patient communities.

CHAPTER VIII

THE ADVENTUROUS ATTITUDE IN SOCIAL WORK

I

One aspect of the scientific spirit has so far been allowed no explicit share in this study of the background of social work. Yet it is extremely important and must have been sensed as a constant overtone in the discussion. I mean the adventurous spirit. Without the gesture of daring, the hardihood of thinking boldly, the undertaking of even the most unpromising experiments, the trying of what appear to be hopelessly unopenable doors, without these science is dead, just as religion without faith is dead. Indeed, as we have already shown, science has had its martyrs for the faith, and it was just that magnificent exhibition of half a century of militant faith which has shaken the world out of its complacency and compelled it to adjust its thinking to a universe of new dimensions. Science, then, is adventure in spirit and method, although to be sure we judge it finally by its works.

Ideas usually pass through at least four stages. First, what might be called the *incubator* or germinal period. Next, the *apologetic*, the stage of tentative search for backing. Third, the *militant* or aggressive stage, when powerful exponents conduct bold propaganda, assume the airs of the victorious, and feel the thrills of conquest. Finally, the *obsolescent* or conventional stage when the idea has outlived its usefulness or everybody is tired of it or it ceases to shock anybody or has been fully integrated to the social tradition. Scientific ideas, such as evolution or eugenics, have been making history in these

modes. Apparently scientific social work is now entering the third stage; and this is by no means an abnormal development. For social work, if it is to be truly scientific and able to prove itself, must partake of the quality of daring and cannot escape the tendency to militancy. This does not mean, however, any counsel to obstinacy or heedlessness or wild-cat schemes—they are antipodal to the spirit of science. Hence its venturesome experiments must be committed to the trained and tried hand and not to the tyro if they are to result in creditable works and the means of genuine social advance.

The war has given opportunity for trying daring social experiments on an unheard-of scale. Now that the agony of suspense is over and the dusts of feverish activity are blowing away it is profitable to examine what has been going on, how these experiments comport with the spirit of science, and how much of war-time social adventuring may be expected to carry over into the permanent life of peace.

Social science, we are told, has not yet reached the stage of being a predictive science, in the same sense that the astronomers are able to forecast an eclipse or a comet's recurrence. We know only too well that it is impossible always to see through in all of their ramifications the possible effects of any piece of social reform or social work. Neither sociologists nor social workers are crystal gazers. But they in common with all scientific workers not only have the right, but are called upon to extract some meaning from their gathering of facts. This is not so much mere prophecy as it is observation of straws blown by certain currents of events. However, in the observation tour which we are about to undertake, we shall not try to play the part of Mr. H. G. Wells and anticipate in great detail what the caldron of events is about to boil forth. If we drop into the prophetic vein we shall try to observe the rules of the game which distinguish scientific observation from amateur prediction.

II

While I have in mind primarily the effect of the war upon social work, I am not interested in predicting how many social workers are going to be able to hold their jobs after the war. Some of us, I hope, will lose them. It is always our business to stimulate preventive measures which will render our own little particular ministrations superfluous. But other kinds of social work will undoubtedly develop. This war may end war, but it will certainly not bring the millennium. Hence, social workers need not look forward to a general demobilization of their brigades. There will still be plenty for them to do. No doubt there will be many shifts in attitude and method. New concepts of relief will probably be established, likewise new educational attitudes, new attitudes between employer and welfare staff. Industrial relations workers, for example, may modify profoundly their view of their jobs; they will perhaps even in some cases begin to play the part of the tail wagging the dog.

In general we may say the great war merely emphasized three ante-bellum trends; namely, the tendencies towards organized criticism and publicity, community control over all community conditions, and the use of trained experts. Not all these are moving at equal rates, however; but on the whole we are moving at a vertiginous speed, and we are learning tremendous lessons without stopping to figure the cost. Just as the Federal Congress with comparatively little discussion voted in one year after the beginning of the war larger appropriations than the total cost of our national government since its foundation, so we are leaping with more than seven-leagued boots in the country's social program. In less than six months after the war America had jumped fifty years or more, and in so far as the army and navy are concerned, distanced every competitor in the world in the matter of social insurance.

Social work in spite of these changes will continue to recognize that social progress is the result of two processes; namely, case work with individuals, formative, reformatory, ameliorative, personal service; and manipulation of mass conditions in the environment, preventive and legislative measures. But in the future social work will probably conceive both of these phases more adventurously.

Since the social worker is so frequently an optimist by the very necessities of his profession, he is quite open to the fallacy of confusing swiftness of motion with actually getting somewhere promptly and surely. Hence, in viewing the war situation, one must observe two general cautions. First, while as individuals and as communities we have learned many new lessons, perhaps they are only like cramming for an examination, or a species of death-bed repentance. Remember that human nature changes but slowly. Second, in spite of the fact that we are more of a nation than ever before, owing to the spread of a vast new network of organizations (for food, coal, transport control, war camp service, Red Cross work, etc.), and although new habits of social perception have sprung into being and new efficiencies and capacities have been uncovered, we must not expect all these new war-born virtues and measures to carry over into peace times. That would put us on a perennial war footing and realize our worst fears of militarism. But some will almost necessarily carry over. People will not easily forget, for example, that if a clubhouse for men in war khaki is a good place as an antidote to the saloon and the brothel in their leisure hours, a clubhouse will be equally good for the homeless man, the unattached casual migratory worker, or the immigrant in times of peace. Neither will it be easy to convince some of our people that if a black man is a good enough American to send to the trenches to save Democracy in France he is not a good enough American to ride in a white man's sleeping car or put up at a

decent hotel, or go to a decent school, or vote unhampered for Democracy at home.

III

The industrial world is experiencing a series of miracles. It is slowly dawning upon us that capitalism as we know it now is not the only nor the eternal economic form. Indeed, does it not look as though old-fashioned *laissez faire* capitalism is on the run? Mr. Schwab blurts out his conviction that the future is to be dominated by the man who labors with his hands. Many reactionary newspapers which were caught napping have made grotesque figures of themselves by attempting to explain what Mr. Schwab meant and by assuring their readers that Mr. Schwab did not realize what he meant or did not say it. Yet Mr. Schwab and other business leaders know exactly what they are talking about. They are sensitive to the drift of events. Mr. Hoover feels it strongly. In his address to the Pittsburgh Press Club in April, 1918, he said: "As I have seen this war develop from an active participation in its backwash and misery, since the first day, I have seen growing out of the masses of people in every country aspirations for a great economic change. That change, broadly, will be that those who work with their hands will obtain a larger portion of this world's goods and those that work with their brains will obtain less." A significant straw here is the fact that American editors are really beginning to take notice of labor-party programs. Recall the columns of news cabled across from England about the after-war reconstruction program of the British Labor Party. The famous visit which President Wilson made to the American Federation of Labor meeting in Buffalo late in 1917 and his address there put the stamp of national recognition upon the principle of collective bargaining.

This principle is becoming more and more one of the

fundamental attitudes of the American government. A still more hopeful sign is the growing recognition of industrial democracy. That the government could print so vivid and frank an avowal of industrial mismanagement as the report of President Wilson's mediation commission on the Arizona mining situation February 10, 1918, and that the government should follow it up by the indictment of twenty-five business men by a federal grand jury, is a pretty clear sign that some leaders are at least becoming aware of the fact that sabotage and the anarchy of direct violent action are swords which employers no less than I. W. W.'s have been used to wielding. The implication is that we are beginning to see how some form of orderly collective bargaining is the only method by which violence in industrial struggles can be diverted. Men are asking themselves which is worse, "ca canny" or sweated wages and speeding up. They are both leaves from the same deadly upas tree, and they represent the same unproductive state of mind manifested by the old schooldame who said, "It's but little they pays me and it's but little I teaches them."

Social workers will necessarily cultivate a closer understanding of and with labor. They must not hesitate to show where they stand, not as timid neutrals awaiting a knock-out fight between workmen and employer, not as Brother Fearfuls afraid of having their heads cut off in some new Labor Reign of Terror, not as accomplices in putting over a class-conscious program, but as real mediators and interpreters, as real teachers, aiding labor to educate and discipline itself for sane and productive citizenship as partners in the common job of making life more tolerable and just. They will do well to remember that labor statesmen though not completely "in the saddle" begin now to share the floor with professional diplomats. They will remember also that these labor statesmen are putting forward new and constructive plans for education, industrial peace, and social justice which

would have seemed utterly Utopian had they not already begun in a measure to realize themselves.

The right, or inevitability perhaps I should say, of eminent domain over both capital and income forces its way month by month to clearer recognition by statesmen, capitalists, and workers. A simple analogy is largely responsible. The workers gave up both capital and income when they went to the trenches. Hence, the stay-at-homes must not only not profiteer, but must pay all the costs. Conscription or draft means a virtual confiscation of both the life and the property of the soldier. While recognizing that men will frequently give their lives much more readily than their purses our rulers are apparently not disposed to halt in their exaction of property as well as life. We seem to be in for what our courts, a few years ago, would have gravely tabooed as confiscation of property. Lloyd George says that capital must pay for the cost of war. Francis Heney urges this as the time to begin now to equalize opportunity by cutting off special privileges and by reacquiring the five fundamental elements of the public domain—timber, coal, oil, natural gas, and water power. Both Lloyd George and Heney may be demagogues, but the ideas they voice are becoming more and more well-articulated public opinion. The new income and excess profits taxes are the surest indication that this idea of eminent domain over property will not be diverted to some future generation, but that it is actually to be put into practice early. And we may be pretty sure that these new adventures in taxation and the lessons learned from them will not be lost immediately after the treaty of peace. The standard books on taxation are in a fair way of being reëdited or scrapped after the present crisis.

There seems to be a pretty well-marked current toward wider control over prices and wages. The British Labor Party demands the fixing of maximum prices and statutory minimum wages. There is a strong possibility that

the war-time measures for conservation of food and for price limitation may prove so satisfactory that they will, in certain fields at least, be carried over into peace times. As to sumptuary legislation, prophecy becomes somewhat difficult. The war necessarily restricted the output of luxuries and through social pressure hindered their consumption. National prohibition is the most outstanding example of this field of activity. War-time prohibition rang the knell of the alcohol traffic in this country. Because the British Army Council issued an order limiting the height of women's leather shoes, some people have become alarmed lest we be regimented and forced into a military control of our dress if not of our occupation. There are two possibilities, however, as to the outcome of this whole business of fixing prices and wages as well as of decreeing what we shall and what we shall not eat or drink or wear. The people may acquire a taste for such regimentation and may demand that it be retained and even extended; or they may, on the other hand, get sick of it and react in the other direction toward an extreme *laissez faire*. Unless all indications fail, our apparent course will be toward present or even more intensive control within certain fields of production and distribution and in the fixing of wages and prices, while in others the normal state of peace economics will be resumed. But even this temporary moratorium on accepted economic "laws" is sufficient to give the conservative supporters of economic orthodoxy *une mauvaise quart d'heure*.

We seem increasingly committed also to the idea of the State as proprietor. Of course for a long time we have been accustomed to the state account system as used in certain prisons for the marketing of prison-produced goods such as binder twine, farm machinery, rag carpets, canned goods, brushes, and brooms. But apparently these feeble beginnings are going to receive an enormous extension. Not only exigencies of the war itself but the stirrings of public opinion and the programs for

social reconstruction are uniting to crystallize a strong demand for further nationalization of basic utilities. The British Labor Party in very measured terms asks for the nationalization of land, railways, mines, and electric power. In America the Nonpartisan League and other agencies more pleasing to the capitalistic press are making similar demands. More cities are considering taking over traction systems. The attorney general of Massachusetts went on record recently as favoring the public purchase and operation of the Boston and Maine Railroad system. Such demands, therefore, are no longer in the nature of outlawry, for they represent the well-thought-out convictions not only of propagandist agencies but of a very numerous group of conservative and successful business men who hold these views even though they do not use the soap box for airing them.

The enormous success of the United States Government's Military and Naval Insurance Act is another straw indicating the way the current of economic events may be expected to turn in the near future. With an army of over 3,000,000 men, the government wrote insurance to the amount of some thirty-seven billions of dollars. This makes it the greatest single life-insurance company in the world, which, without having an actual monopoly, cannot fail to be a dominating factor in the insurance business of the whole country. Whether the idea of military preparedness leads America into creating an enlarged permanent military establishment profiting by the present generous insurance plan or not, government insurance on a huge scale is evidently here to stay. Whether this will mean that in the process of reconstruction the government will tend to squat on the whole insurance field is a matter beyond prophecy. There is no doubt, however, that the strong hand of the government will act as a further stabilizer of the insurance business. The very necessity for working out some *modus operandi* whereby war-time insurance can be converted into or-

dinary life insurance means that some sort of understanding must be reached with the private insurance companies. This in all probability will result in pretty close government regulation and control. From the standpoint of insurance as an idea, this policy is of great significance. It means that the pressure brought upon enlisted men to insure under the government act will teach them the value of insurance either under some form of ordinary commercial life insurance or some contributory form of state insurance. It means also that men who have already been carrying small insurance policies will probably increase them; for instance, there are many cases reported of men who have been carrying a thousand dollar policy in a commercial company who now have taken the full ten-thousand dollar limit allowed under the government scheme. There seems, however, to be no indication that the government insurance scheme is going to crush out private companies. To the contrary, for the first year after the government's policy went into effect, some of the big private insurance companies claim they did a larger business than ever, indicating what I just pointed out; namely, that the whole concept of insurance has been stimulated and is making an appeal to men who never considered it seriously before. In spite of the very marked tendency of many discharged soldiers to allow their war-time policies to lapse, the lesson and the stimulus cannot wholly be lost.

As a more or less conscious corollary to these schemes of insurance must be noted the apparent disposition on the part of this country to handle more vigorously than ever the unemployment evil. The British Labor Party in its reconstruction program calls for a national and imperial policy for the abolition of unemployment from the British Empire.

"It has always been a fundamental principle of the Labor Party (a point on which, significantly enough, it has not been

followed by either of the other political parties) that, in a modern industrial community, it is one of the foremost obligations of the government to find, for every willing worker, whether by hand or by brain, productive work at standard rates.

"It is accordingly the duty of the government to adopt a policy of deliberately and systematically preventing the occurrence of unemployment, instead of (as heretofore) letting unemployment occur, and then seeking, vainly and expensively, to relieve the unemployed. It is now known that the government can, if it chooses, arrange the public works and the orders of national departments and local authorities in such a way as to maintain the aggregate demand for labor in the whole kingdom (including that of capitalist employers) approximately at a uniform level from year to year; and it is therefore a primary obligation of the government to prevent any considerable or widespread fluctuations in the total numbers employed in times of good or bad trade. But this is not all. In order to prepare for the possibility of there being any unemployment, either in the course of demobilization or in the first years of peace, it is essential that the government should make all necessary preparations for putting instantly in hand, directly or through the local authorities, such urgently needed public works as (a) the rehousing of the population alike in rural districts, mining villages, and town slums, to the extent possibly of a million new cottages and an outlay of three hundred millions sterling; (b) the immediate making good of the shortage of schools, training colleges, technical colleges, etc., and the engagement of the necessary additional teaching, clerical, and administrative staffs; (c) new roads; (d) light railways; (e) the unification and reorganization of the railway and canal system; (f) afforestation; (g) the reclamation of land; (h) the development and better equipment of our ports and harbors; (i) the opening up of access to land by co-operative small holdings and in other practicable ways. Moreover, in order to relieve any pressure of an overstocked labor market, the opportunity should be taken, if unemployment should threaten to become widespread, (a) immediately to raise the school-leaving age to 16; (b) greatly to increase the number of scholarships and bursaries for secondary and higher education; and (c) substantially to shorten the hours of labor of all young persons, even to a greater extent than the eight hours per week contemplated in the new education bill, in order to enable them to attend technical and other classes in the daytime. Finally, wherever practicable,

the hours of adult labor should be reduced to not more than forty-eight per week, without reduction of the standard rates of wages."

In our own country the Department of Labor is taking hold resolutely of the situation and is extending and coördinating its system of employment bureaus in so far as congressional imagination allows it funds.

The government's land and housing policy is another remarkable departure from staid orthodox economic policy. Both Maine and California are now either making loans to farmers or else preparing good land for their settlement. This is by no means the old policy of simply turning loose ardent young people upon unbroken and untracked public land where they would work their souls out in the bitterness of trying to wrest a living from the savage frontier. There is a vigorous demand in many quarters for extension of this policy of utilizing good public lands as a method of easing up the pressure of demobilization. This is proposed also in England, Canada, and Australia. Land for soldiers has always been an attractive method of taking up the industrial slack at the end of a war, but it has so frequently been a wasteful and heart-eating proposition that the new administrative intelligence will probably follow the lead of California rather than our own precedent after the Civil War. The strong letter which Secretary Lane wrote to President Wilson in June, 1918, heightens this conviction. He said, in part:

"My Dear Mr. President: I believe the time has come when we should give thought to the preparation of plans for providing opportunity for our soldiers returning from the war. Because this department has handled similar problems, I consider it my duty to bring this matter to the attention of yourself and Congress.

"At the close of the Civil War America faced a somewhat similar situation. But fortunately at that time the public domain offered opportunity to the home-returning soldiers. The great part the veterans of that war played in developing the West is one of our epics. The homestead law had been signed by Lincoln

in the second year of the war, so that out of our wealth in lands we had farms to offer the million of veterans. It was also the era of transcontinental railway construction. It was likewise the period of rapid, yet broad and full, development of towns and communities and states.

"To the great number of returning soldiers land will offer the great and fundamental opportunity. The experience of wars points out the lesson that our service men, because of army life with its openness and activity, will largely seek out-of-doors vocations and occupations. This fact is accepted by the allied European nations. That is why their programs and policies of relocating and readjustment emphasize the opportunities on the land for the returning soldier. The question then is 'What land can be made available for farm homes for our soldiers?'

"We do not have the bountiful public domain of the sixties and seventies. In a literal sense, for the use of it on a generous scale for soldier farm homes as in the sixties, 'the public domain is gone.' The official figures at the end of the fiscal year, June 30, 1917, show this: We have unappropriated land in the continental United States to the amount of 230,657,755 acres. It is safe to say that not one half of this land will ever prove to be cultivable in any sense.

"While we do not have that matchless public domain of '65, we do have millions of acres of undeveloped lands that can be made available for our home-coming soldiers. We have arid lands in the West; cut-over lands in the Northwest, Lake States, and South; and also swamp lands in the Middle West and South, which can be made available through the proper development. Much of this land can be made suitable for farm homes if properly handled. But it will require that each type of land be dealt with in its own particular fashion. The arid land will require water, the cut-over land will require clearing, and the swamp land must be drained. Without any of these aids, they remain largely 'No Man's Land.' The solution of these problems is no new thing. In the admirable achievement of the Reclamation Service in reclamation and drainage we have abundant proof of what can be done.

"Looking toward the construction of additional projects, I am glad to say that plans and investigations have been under way for some time. . . Any plan for the development of land for the returning soldier will come face to face with the fact that a new policy will have to meet the new conditions. The era of free or cheap

land in the United States has passed. We must meet the new conditions of developing lands in advance—security must to a degree displace speculation.

“There are certain tendencies which we ought to face frankly in our consideration of a policy for land for the home-coming soldier. First, the drift to farm tenancy. The experience of the world shows without question that the happiest people, the best farms, and the soundest political conditions are found where the farmer owns the home and the farm lands. . . . It is evident that since the war in Europe, there has been a decided increase in the trend toward the city, because of industrial conditions. The adoption by the United States of new policies in its land-development plans for returning veterans will also contribute to the amelioration of these two dangers to American life.

“A plan of land development, whereby land is developed in large areas, subdivided into individual farms, then sold to actual bona-fide farmers on a long-time payment basis, has been in force not only in the United States under the Reclamation Act, but also in many other countries for several years. It has proved a distinct success.

“A very small sum of money put into the hands of men of thought, experience, and vision will give us a program which will make us feel entirely confident that we are not to be submerged industrially or otherwise by labor which we will not be able to absorb, or that we would be in a condition where we would show a lack of respect for those who return as heroes, but who will be without means of immediate self-support. A million or two dollars, if appropriated now, will put this work well under way.

“This plan does not contemplate anything like charity to the soldier. He is not to be given a bounty. He is not to be made to feel that he is a dependent. On the contrary, he is to continue in a sense in the service of the government. Instead of destroying our enemies he is to develop our resources.”

It thus appears that this demand for land for discharged soldiers is from certain angles inseparably identified with the work in vocational reëducation and rehabilitation of the war-disabled.

Closely allied to the call for a new public-land policy is the government's manifest determination to enter at last upon a definite city planning and housing policy.

The appointment of national housing administrators and the creation of a housing corporation within the Department of Labor indicates that however tardily we may have entered the game, we are in it to stay. While this was a war emergency measure, and despite congressional mangling of the scheme immediately after the armistice, it is not likely to be confined to the period of the war. Our newly found contacts with Europe will make it much easier to bring across the Atlantic the new ideas in this field which a generation's work over there has accumulated. It is to be remembered that European warring nations even in the midst of their manifold problems have been tremendously concerned over housing and town planning. The building up of new munition centers, the cry for taking advantage of the period of demobilization to relieve city slums and unnecessary congestion, together with the reconstruction of devastated towns, will give an impetus to new scientific town planning. The proof that these ideas are penetrating America is that special courses on the subject of scientific town planning and reconstruction work are already proposed by certain American colleges. There is every prospect that with the multiplying of city planning commissions some of these projects will finally come to a head instead of being merely filed away on already overloaded library shelves.

We may forecast, moreover, an increasing acceptance of the principle of the white label and other production standards. The Council of National Defense early after its creation recommended for all manufacturers of government supplies proper standards regarding women's working hours, wages, sanitary conditions, etc. The Secretary of War in his creation of the board of standards for clothing manufacture, although it was abolished a few months after its creation, fixed a policy which was assumed definitely by the War Department for the control of its purchases. This, no doubt, was due to the fact that

Mr. Baker was president of the National Consumers' League; but the fact that he took such a stand cannot fail of effect through the country at large. It has set the broad official seal of disapproval upon sweated industry.

IV

The prophet now approaches a little closer the problems of the future as they concern more intimately the social worker. What, for instance, is there in store for organized criticism and publicity? This question is pertinent for at least two reasons. First, because so much social work is the result of organized investigation and publicity focused upon social disabilities which need lightening or removal; and second, because many social workers are regularly employed in such publicity. We recognize that government in war time is to a considerable extent a repressive machine. War necessitates a good deal of apparently arbitrary action in the interest of securing that social coherence without which vigorous and successful prosecution of a war seems impossible. But does that mean we shall become habituated to censorship and the crushing of freedom of speech, assemblage, and our other ancient rights guaranteed by constitutions and statutes? Remember that constitutions can never guarantee absolute rights. They rather state desirable ideals, as we have demonstrated in the analysis of "natural rights." I, for one, have no fear but that after the spasm of war hysteria is over, we shall resume our feast of "pitiless publicity," and the courts will begin to reverse the acts of scared legislatures and executives,¹ and this even

¹ A significant example has occurred in Minnesota. The State Supreme Court reversed an order of the governor who had removed from office a county probate judge on grounds of opposing the war policy of the United States. The court held that elected public officials can be removed only for malfeasance and not for acts and conduct having no relation or connection with performance of

while fully recognizing the possible attempt to fasten upon us the habit of accepting "treated" news or prepared or safe or official news as a method of quenching liberal inquiry and propaganda. Meanwhile, it is quite remarkable how much has been achieved in the last three years by the Federal Children's Bureau and the Bureau of Labor Statistics. For example, three monumental studies of infant mortality in relation to income have been made by the Children's Bureau within this period. If there is any tendency to suppress legitimate social investigation these studies would long ago have been crushed to the ground, because they are brimful of confirmation for the demands of those dangerous incendiaries who have been urging national minima! In all probability these bureaus will go on increasing their value and significance as research and publicity agencies. Is it not possible that in addition to them the enormous publicity work of the surgeon general's office and the federal board for vocational education will continue? Is it possible or desirable, further, that we should have a government intelligence bureau for the purpose of giving out facts, political, economic, social, international, like weather or crop reports or the monthly review of the Bureau of Labor Statistics? I can see great danger in issuing a special periodical apologetic for the government. It might easily become the agency for Junkerdom and bu-

official duty. "Scolding the President of the United States, particularly at long range," remarks the court, "condemning in a strong voice the war policy of the federal authorities, expressing sympathy with Germany, justifying the sinking of the *Lusitania*, by remarks made by a public officer of the jurisdiction and limited authority possessed by a judge of probate under the constitution and laws of this state do not constitute malfeasance in the discharge of official duties and therefore furnish no legal ground for removal." Wholesome doctrine, however much we deplore the lack of real perception and patriotism in the officer in question, and much easier to hand down after the actual close of hostilities.

reaucracy. On the other hand, for the proper creation of public opinion, it is fundamental that somehow or other we get plain, unvarnished, uncolored statements of fact such as the commercialized public press cannot or does not furnish us now. We are almost reduced to the necessity of choosing between foundations for news distribution or government bureaus.

In the field of control and administration of philanthropy the plow of new opinion is driving deep furrows. Just as the Civil War gave an impetus to state centralized care of dependents, defectives, and delinquents, so the recent war has promoted federalized as well as state interest in these matters. The problems of the draft, of demobilization, of insurance are reënfencing the trend toward public and away from private relief systems. Moreover, financial pressure may act as the selective force against weaker and less efficient social agencies, particularly, may it be hoped, against those which are dead-centered and which have been merely living upon their laurels.

The huge proportions of the war problem have been reflected in the reorganization of great welfare agencies upon a similar huge pattern. The Red Cross is now the greatest corporation in the world. Business men welcome it as an admission of the value of big business methods. Many of them would extend the principle of local charity indorsement to a national scale and would make the Red Cross or some other equally big agency the licenser of all philanthropies, war or peace. Does this mean at last the trustification of philanthropy? One of my friends writes asking: "Should the home service of the Red Cross, now organized on a national basis, be developed and intensified so that it would be practically taking the place of local organized charity and local public outdoor relief?" The fear implicit in this letter is rather widespread. I doubt, however, if it will be realized. While the new movement cannot fail to affect pro-

foundly local relief agencies and their methods, and while local agencies may appreciate whatever financial stimulus or direct grants may come from the big war agencies, they are not ready yet to surrender their private interests and prerogatives.

From the standpoint of the individual social worker who has taken service during the war with one of these big agencies, a somewhat tangled prospect appears. For example, the prestige of the Red Cross makes the social worker's problem much easier. It greases the skids for workers and is the open sesame to many doors which it is difficult for ordinary charity organization society workers to open. Lawyers, doctors, dentists, undertakers, all give liberally of their time, much of it absolutely free, and hospitals take Red Cross cases on a fifty-fifty basis. Both professional and volunteer workers may trade on this prestige during war time or they may get an undue idea of the ease with which their problems clear up. All of this means that when they get back to their regular offices with all the old problems of finance and hostile criticism they are likely to suffer the psychology of shell shock and feel a sense of futility and depression. But on the other hand, it is altogether possible—is it not?—that some of this great war program of social work will have so familiarized people with social work under the magical name of Red Cross or rehabilitating the disabled soldier that it may carry over into peace times and help allay some suspicions and prejudices against organized social work. While I do not look for any immediate national organization even of home-service work in the Red Cross upon the same extensive and intensive plan which rules at present, there is a strong probability that this magnificent war organization will not be allowed to go to pieces and rust in times of peace, but that it will be maintained and applied to some specific field of social work such, for example, as public health.

The financial aspect of this problem while not domi-

nant, perhaps, is none the less extremely attractive to the prophet. The Red Cross has taught us many things about charitable publicity and finance, and these lessons are sure to carry over into peace times even though it may not continue as a partner on a half and half basis with local relief agencies. The war has pruned the support of some agencies, has swelled the finances of others, has scared some givers, is inspiring others. But the net result is that giving is more universal and more democratic than ever before. The habit of giving like that of insurance has been formed by thousands who never thought it possible heretofore. The business of thrift goes hand in hand with that of benevolence and reaches down even into the elementary school. In a Red Cross membership campaign at Christmas, I called at a house where a little girl danced up and down as she threw open the door. She had been watching the team of solicitors from her window and was frightened at the thought that perhaps we might pass her house by. She had learned at school about the Red Cross and had acted as a missionary in her neighborhood. When even the children of the street are thrilled by the prospect of giving, it is not crazy optimism to believe that a new sense of service may be in process of formation for the coming generation.

Unless all signs fail, philanthropic finance for the next generation will be adventurous finance. Social workers may not have to beg for every penny they need to spend upon preventive programs. The war has taught us that the day of miracles is not over. It has also taught us the value of the experimental method even though that experiment involves tremendous financial outlay. Norman Angell observed a while ago that the conviction that governmental action can make economic adjustments of much wider scope than was supposed and the conviction of its moral justification are to focus upon a third phenomenon; namely, the determination in the future to be adventurous and experimental in social reform. Says he:

"When the English 'maximalist' is told, as of course the economists will tell him, that his programs will fail, his relation to some years of war experience prompts him to take the line: 'Suppose it does fail, and we have to try something else? Will it cost ten million lives, the youth of a whole generation, like the war?' He has seen certain military enterprises utterly fail, enterprises which he knew were considered gambles by those who ordered them, and which in fact were afterwards condemned officially as errors. Yet those who, in the circumstances, perhaps rightly, ordered those gambles knew they would cost dreadful suffering, unimaginable horrors, innumerable lives. When therefore he is told that his industrial experiment will disturb credit and upset trade, he will be quite unimpressed. He will certainly take the risk. He will introduce a little of the strenuousness and adventure of war into the life of peace, and make it a little less 'soft and slothful.'"

For the financing of these adventures in social reform, surely the income tax will be retained and extended; and new forms of taxation will probably be found, particularly on marginal businesses such as child-labor industries and on excess profits. Moreover, disarmament or limitation of armament is likely if sane counsels prevail in peace negotiations and after. This will mean not only the releasing of vast energies for the production of food, clothing, shelter, education, and other preventives of social misery but also the enlisting of huge sums of capital and income for funding social amelioration and progressive experimentation.

For a while it looked as though the principle of the financial federation would receive a strong reënforcement by war finance and for a few weeks the war-chest fad threatened to sweep the country. However, the brakes were suddenly thrown on by the very agencies such as the Red Cross and the Y. M. C. A. from which the impulse was supposed to have been derived. Notwith-

standing the fact that these mighty agencies had to bow before public persuasion and cast in their lot with lesser national and local agencies in the war-chest drives, or that these drives have been uniformly successful in two hundred cities, it is quite evident that financial federations are not going to sweep all before them in an easy conquest. If they do succeed in conquering the country it will not be through steam-roller invasion but by nibbling trench warfare. Meanwhile, nearly two score cities have definitely undertaken to transform their war chests into community chests for financing local welfare agencies.

V

For carrying through this work of adventurous social reform there is no question but that there will be an increasing demand for trained social experts. Social work is recognized as never before by the national government and by hundreds of business and professional men as the result of various "drives" and actual personal service. Therefore, as never before, there is laid upon all social workers the responsibility for justifying the faith placed in them. In carrying out the broadened community projects incident to war, to demobilization and to reconstruction thereafter, more social workers than ever will be needed. The training schools for social work register this increased pressure of demand, for their classes are larger than ever. This is not only a question of the professional but also of the volunteer. The Red Cross has been spreading ideas of skilled social work in more than three thousand communities, issuing pamphlets on social work in editions of one hundred thousand and more, and training through its home service institutes hundreds of volunteers many of whom will or should want to go further into real professional work. Churches, too, are learning the value of training and organization in social work.

Two special problems crop out of these facts; namely, how to retain these trained volunteers after the war motive subsides, and what will be the effect of war work and volunteer service upon accepted standards of social technique. In answer to the first of these questions, I should say that there are four future uses for the volunteers. They may be used as territorials somewhat like the Red Cross nurses, subject to emergency call in times of disaster. They may be used in the new public relief as that system approaches, as institution visitors, as members of county boards of child welfare, volunteer probation officers, parole officers, mothers' pension investigators. They may be used for school and child-welfare work as leaders of more effective parent and teachers' associations and the like, and as supporters of both public and private agencies doing such work. They may be used also as radiating centers for social publicity in extending the ideas of social work into outlying districts, the small towns, villages, and open country, and as local correspondents for the creation of public opinion which may be brought to bear upon legislators when questions of social-welfare policy arise.

In answer to the second question it may be said that there is no necessary reason why war work should relax the standards of sound social technique. There is, of course, some practical danger that sentimentality and the fear of public criticism may provoke unwise open-handedness and mere good-natured contacts instead of scientific social work. This means some danger of pauperization and insistence upon the right to relief. The maintenance of the insurance attitude as the guiding thought particularly in Red Cross home-service work means that these dangers are minimized; hence this wide extension of war-relief work by utilizing trained social workers may even bring about a material reduction of the dependent attitude which would easily grow up under the patronage of thousands of little unorganized sentimental agencies.

Neither is there any apparent special danger of diluting social work as a profession with half-trained volunteers, providing these volunteers fully realize that they are only half trained and do not misuse their opportunity to learn. It is best to safeguard both the volunteers and their clients by insisting that while, for example, Red Cross home-service work is essentially insurance work of the complementary type, no insurance plan however well devised can soften every vicissitude nor can it work without the wholehearted coöperation of the insured.

War work may actually have improved technique by jarring workers out of their routine, by changing workers to new jobs and new types of work, by eliminating whatever of condescension or mere detective methods still lingered on in organized relief, by broadening scope and vision through contact with bankers and manufacturers and soldiers and professors, by experiences in Europe with great creative plans for rebuilding towns, rehabilitating refugees, reclaiming war cripples, etc., by international exchange of successful methods or bitter failures, by dint of having to meet larger intakes of cases and problems with straightened financial support.

VI

I have already hinted that we have moved forward with seven-leagued boots in our conception of the value of organized community recreation in promoting physical and mental efficiency and in maintaining military morale. The Y. M. C. A. may be counted on not to lose the momentum it has achieved but to maintain it through its wonderful organization. Likewise, the Playground and Recreation Association of America has secured through its War Camp Community Service a new following and a new prestige. If its soldiers' and sailors' clubhouses and hang-outs are not maintained permanently it will be because other and more strategically located centers

have been provided to carry out the identical principle of looking after the welfare of single men enlisted in seasonal industry.

Perhaps we shall not need recreational substitutes for saloons or brothels, but I believe we shall; for the play instinct and the sex instinct are imperious and if balked of innocent and legitimate expression will find their satisfactions by devious channels. Perhaps I ought to use the new term "sublimation" instead of substitution, because that term signifies not only substitution but also transformation and development of an impulse. It should be possible in this process of sublimation through recreation to stimulate creative art expression in the masses of American manhood. This possibility is rendered all the more likely because of the new artistic horizons which were opened to our men in France: for going across the seas meant not only rewriting the history and geography which they learned in their elementary school days; it meant also bringing these men into contact with two thousand years of artistic development in a country particularly sensitive and particularly fertile in the field of art.

Let the Long Faces shake their gloomy heads and cry this is no time for play, war and reconstruction are serious work, business is man's chief end and good, put away childish things. In the end we shall learn that democracy demands for its success two things: not the bread and circuses of the cynic, but a certain amount of material prosperity and leisure, leisure for thought and for play, and prosperity wherewith to pay the piper.

The problem of educational reconstruction is of vital concern to social workers because of our increased faith in technical or vocational education as a partial remedy for individual and social unpreparedness. There is also a new faith in the possibility of reclaiming and utilizing "human scrap" through education, the reëducation of the war-disabled, of the work-shy, of the industrial mis-

fits. The minority report of the Royal Commission on the Poor Laws pointed out these possibilities to us at least ten years ago, but it took the catastrophe of war to force upon us the magnificent concept which that report contained. Hence I look for a very wide extension of vocational training, of continuation schools, of physical education, and instruction in social hygiene. I anticipate also an extension of school and home visitors, the all-year use of school plants, of vocational guidance, of social-center utilization of school plants for continuation school work, and the like.

We shall probably witness also an extension of the period of compulsory schooling in some form or other to the age of eighteen or beyond, just as we see the age of consent and the Juvenile Court age rising. I am not sure but that we may see some form of universal community service exacted of all youths as the climax to their education, either as a tribute to the vision of the psychologists who, like William James, have been looking for moral equivalents of military training for service, or to the theories of the constructive sociologists who aim at creating contributive types of personality, or even as a compromise with the propagandists for universal military service. I should not be surprised to see a new emphasis and a new direction given to manual training by providing it with some real point such, for example, as has been offered by the Junior Red Cross manual. Sloyd work and other forms of manual crafts take on a new meaning when they are done under some strong impulse like war, for the saving of life or for conserving health and man power.

If there is any doubt as to the connection between the new educational work, the war, and social work, let it be dispersed immediately in the light of the humiliating discovery of seven hundred thousand men of draft age who could neither read nor write and of the still more humiliating discovery that there are over five and a half

million illiterates over the age of ten in this America of ours, this leader of democracy. Social workers will render a notable service to the country by backing up Secretary Lane's proposal to President Wilson for a bill to end America's illiteracy, or even perhaps by going a step further with the creation of a really active United States department of education which could correlate and develop the various educational services on behalf of the negro, the immigrant, the rural child, and other forgotten armies in our midst.

Among other significant straws, we must not overlook the health problem. In general it is safe to forecast a much more intense activity for health conservation, also a keener perception of the significance of infant mortality and protected maternity. The challenge of tuberculosis in France and the experiences of trench life will recall attention to the problem of causative factors of tuberculosis in both town and country. Likewise the emergency call for war housing has forced upon the governments of all the warring nations some attention to decent housing as a factor in health and productivity. Furthermore we are witnessing an increased attention to mental hygiene as a health consideration. This fact was iterated and reiterated day after day at the National Conference of Social Work in Kansas City, 1918. It resounded through the Conference on Demobilization and in the meetings of American public health officials during the winter of 1918. The developing of psychiatric social work on behalf of the war-disabled is further evidence of the disposition of the government and social workers to take the necessary forward steps in this field of mental hygiene.¹

I have already spoken of the probable effects of the

¹ Particularly noteworthy and commendable are the monographs and reports on neuropsychiatry issued by the National Committee for Mental Hygiene.

great coördinating plan between the United States Government, the Red Cross, and other agencies for the reclamation of "human scrap," but what will happen when the jingoists and propagandists for universal military service run up against the fact of physical defects in the young man drafted for military service? An incredible number, for example, of rural young men were rejected by the military examiners. This fact should shock the country out of its dream of ideal health conditions automatically prevalent on the farms. The fact is that most of this physical degeneration results from defective social environments, as was proved by the great British Interdepartmental Report on Physical Degeneration published ten years ago as the aftermath of the Boer War. Certain of the standpat newspapers have been printing editorials glorifying universal military service as the cure for physical defects. I quote from one of the most rampant of these journals:

"On the score of health alone military training stands approved in every unbiased mind. What it will do in a few months to remake and upbuild young men physically is now a matter of demonstrated fact in every camp in the land. The change from weakness to strength, from the slouch to the upstanding poise, from sallowness to ruddiness, from laggard to jubilant feet, from lusterless to clear eyes—it is a transformation to marvel at and to delight in. It means a better store of energy to apply during a lifetime to the tasks of farm, factory, office, and shop. It will make democracy more efficient, life sweeter, men happier, posterity sturdier."

It is perfect nonsense to assume that even the United States Army can make silken purses out of sows' ears. No military man would attempt to produce a good soldier out of a rotten body and a weakened mind. The army wants men potentially fit. The remedy for physical degeneration, then, is not universal military service but a broad constructive program of community health, food, recreation, housing, and all of the other factors which

make for physical soundness, mental poise, and social wholesomeness. One is not surprised to find that from the British report may be gathered abundant testimony by military men confirming just these contentions of the public-health workers and the social reformers. True preparedness must begin one lap at least ahead of military service. The army and navy should not be expected to cumber themselves with the job of repairing the social neglect of both city and country the nation over.

It is very evident that the program of social-hygiene education, of repressive measures, and of clinical treatment of venereal disease will carry over into peace times. The taboo on discussion of this subject has been pried off. The conspiracy of silence is broken. Sex disease is no longer a private weakness or folly but a grave public concern. Much of whatever reticence and secrecy still remain may be overcome by properly dividing the problem into its two phases of physical healing and moral regeneration. The diverse agencies which are working on these two aspects of the problem now; namely, the government, the Y. M. C. A., the American Bureau of Social Hygiene, state boards of health, and certain private societies will scarcely relinquish their undertakings or scrap their organizations when the particular war emergency is passed. When the communities fully realize that it has been actually far safer for a young man to be in and about one of the training camps or posts of the United States Army than to walk the streets of the average American town, they will hardly fail to connect cause and effect and to recognize that the preventive and curative measures adopted to maintain military morale are equally valuable as public-health measures in times of peace. The proposal by the government to create an interdepartment bureau of social hygiene with large appropriations for community research indicates that so far as the public authorities are concerned at least, there is a firm resolution to make this work an integral

part of public policy hereafter. Finally, as I have already suggested, there is a possibility that the Red Cross might become a great health promoting agency particularly through its civilian relief department after its war work is done. There will be no danger in such an adaptation of Red Cross machinery if it is not tied up to some special medical interest and if it is made a genuine public-health agency for the furtherance of preventive sanitation both rural and city.

In all probability the whole immigration question will take on new coloring as the result of war's ravages in Europe and of our new rapprochements with our allies. It is quite to be expected that some measure of discrimination in hospitality will be extended to prospective migrants from Europe. Whether any very definite boycott against immigration from present alien enemy nations will be consummated along with some form of economic boycott cannot at present be predicted. But there is good reason for believing that many European countries will not only not encourage emigration but will probably take definite steps by attractive measures to persuade intending emigrants to stay at home. The rebuilding of European economic life will probably claim most of the able-bodied men heretofore constituting the bird-of-passage type of emigrant. At home we are faced with a vigorous determination to translate into fact our pious wishes about peaceful or attractive assimilation of the foreign born in our midst. This does not mean ruthless Americanization, nor coercive methods such as have characterized either Prussia or Russia in their dealings with Alsace or Schleswig-Holstein or Ruthenia. It does mean opening up immigrant pools through settling the "language question" and through requiring that fundamental instruction in both private and public schools shall be in English. It also means utilizing settlements, social centers, night schools, continuation schools, and other agencies for citizenship. Already

through legislation and through community organization this work of Americanization is being undertaken. The foreign-language school which under the guise of religious liberty or through a too unsuspecting tolerance had become a center of anti-American propaganda, is now upon the operating table. State councils of defense and state legislatures are being called upon to settle this question and to insure that every person in this country shall have ready access through the common language to all the cultural inheritance which America has to offer.

Incidentally this new emphasis upon education will almost necessarily mean strengthening the movement for a reasonable working day which would admit of a certain amount of leisure for education. Sheer physical fatigue as a result of a long working day has been the ally of deliberate foreign propaganda in preventing the assimilation of thousands of well-meaning immigrants. Neither should we overlook the significance of the negro migration northward. This new contact of the negro with the North, his new taste of free movement, and his coservice in the armies of the republic will change and are already changing the attitude of the South. They will also create many new problems of housing, health, unemployment, and illegitimacy in our northern communities. This must mean not only a broad policy on the part of the communities where the negroes locate, but also the developing of a much larger corps of professionally trained negro social workers to mediate between the newcomers and their neighbors and to help in the process of adjustment.

Would it be too much of a strain upon our imagination to forecast, as the result of military training of millions of young men of impressionable years and as the result also of war-time measures in food conservation, price fixing and health work, a new respect for law? Citizens are learning not merely to tolerate the law but to coöperate in administering the law; for instance, with regard to

espionage, treason, and prostitution. But that we have a long way to go and that the millennium is hardly yet within hail is indicated by the prevalence still of lynching and mob violence. The terrorism of the mob is just as bad as Junker autocracy whether it is a question of burning a negro in Georgia or lynching an Illinois miner with a German name, or hustling out of town a speaker ready for an address in defense of Tom Mooney in California, or of deporting I. W. W.'s from Bisbee. The fact, that taking the country as a whole, the prison and reformatory population shows a marked reduction is not necessarily attributable to any gain in respect for law, but probably rather to military enlistment of the adventurous and of a large number of casual workers, and also to the control of the sale of liquor. At the same time there is much of suggestion in this fact to point the way for social policy in reducing the rate of crime with the return of peace. So far as can be seen now, it is going to take much more than a world war to improve very much our present system of criminal procedure. Perhaps the new contact of America with English and continental criminal law will mean spreading much more generally the demand for improvement which has heretofore been sounded only by a few leaders of the bar like ex-President Taft and Elihu Root.

The new stirrings in the woman's movement is also a significant mark of the trend of the times. Women's economic services in the war have become what Mr. Asquith called the "unanswerable argument" for the extension of suffrage. With the settlement of the suffrage issue, an enormous store of energy will be released from suffrage propaganda to other constructive social efforts. The education incidental to winning the suffrage ought to yield a larger, more intelligent, and perhaps militant public backing to social work. The war itself has opened up new phases of public work to women, or at least has emphasized their inherent fitness for them; both in

England and America they are serving as police, as constables, as recruiting agents for food conservation, in special protective work for girls. Since the beginning of the war nearly two hundred and fifty thousand women have been added to the government service in this country alone. This new training in administrative ability ought to yield valuable by-products to social work.

The prophet ceases. Not from weariness nor discouragement, however; for he lines up with Amos and Joel rather than with Jeremiah. But why prophesy when the event is already upon us? Scientific social work and heightened social perception are growing apace. New definitions of human rights and of social justice are hammering themselves out upon the anvils of world tragedy. Our young men see visions and even some of our old men begin to dream dreams. It is to no small degree in the hands of social workers to redeem those visions from mere hallucination and to translate those dreams into sober fact. If this Great War ends war it will do so only because we have helped to canalize the energies which now race torrentially toward military destruction, and to turn them in the direction of solving those inexorable, indivertible social problems which without the slightest resort to metaphor may well be called the moral equivalents of war.

CHAPTER IX

SOCIAL PROGRESS AND SOCIAL WORK

In those rare moments when the busy professional person seizes a bit of leisure to think some show of order into the tangled mass of events that assail him day after day, he is frequently the victim of two opposing ideas. First he succumbs to a sense of futility, the foolishness of trying to do anything with this disease called human life or civilization or to the conviction that we are but the footballs of circumstance, the puppets of blind forces beyond mortal reach. Or else he shakes off this supine and paralyzing belief and flies to the other extreme, becomes exhilarated by the thought that man is the measure of all things, and ends by preening himself upon being the real Atlas who carries the world and would not yield it up even to Hercules himself. But between these two extremes of passive pessimism and unctuous egotism there lies a middle ground which may be surveyed in the scientific spirit as the basis for a sound structure of the principles and practice of social progress. And it is on this middle ground that the social worker must plant himself.

The notion of progress is neither a joke nor a chimera. It is a scientific concept, just about as definite as most leading ideas in this world, although not claiming the fine simplicity of a mathematical formula. This concept involves the idea that man is potentially progressive and modifiable in nature. One suggestive proof at least is modern man's threefold superiority to his primitive ancestry. Modern man has outstripped primitive life through the mass and sweep of his intelligence, through

inventions for insuring him against raw Nature's vicissitudes, and through his social integration. Progress as we conceive it involves, moreover, the idea of active control over fate; of mastery over blind drift. That is to say, progress is not inevitable nor automatic nor universal nor in the nature of things; it is rather rare, it is costly, and it comes only through human effort rightly directed, through the ministry of thought, through intelligence consecrated to the supreme purpose of human betterment. Man must work out his own salvation, he must control or perish, he must learn the rules of the game in order to utilize the forces of the universe for his own purposes; but he must have a purpose. Hence resolute determination is fundamental; mere pious longing or daydreaming of Utopias will not do the job. It may be that in spite of taking thought to master fate and captain its soul humanity may perish stillborn in the womb of an unwilling Mother Nature or may be devoured by hostile cosmic forces; but it is safe to say that without effort such a fate is almost inevitable, while with it there is at least a good fighting chance of victory and improvement.

To that putting forth of effort the social worker contributes in two ways: through case work with individuals or families, and through general measures of utility to whole classes or groups. Case work recognizes that social advance requires a progressive amelioration of human character, growth in knowledge, self-control, productive capacity, obedience, loyalty, thrift, teamwork, unselfishness, prudence, and imagination. Legislation and other mass measures for social reconstruction recognize, on the other hand, that human character cannot develop in a vacuum nor subsist on nothing: it needs a proper social environment with education, discipline, controls, rewards, penalties, and opportunity. Let me illustrate.

Social life, we say in sociology, is determined by three

great "controls," the physical environment, man's own nature (physical and mental inheritance), and social heredity (institutions, customs, beliefs, laws, and the like). Now in each of these fields of control social work may perform its twofold function. For example, the physical environment may rise up and smite, as it frequently does, by earthquake or volcano or cyclone or flood or tornado. Social work hastens to soften the blow by disaster relief to individuals. Incidentally, however, it gathers the facts with which to point the way to flood and fire prevention, or other methods of protecting whole companies of men against the wild vagaries of physical nature. Again, social work may figure in the field of biological control, either negatively by preventing the adverse selection which results from unwise charity, or positively through aiding favorable selection by offering to natural endowments of mind and body the widest and freest social opportunity for development. The social worker who checks the mating and the multiplying of the feeble-minded or venereal is serving racial progress by preserving the level of racial fitness won through long ages of biological selection. Likewise by rescuing sound, fit children and placing them in decent homes social work aids both social and racial progress since it saves and releases potential productive capacity.

When we come to the rôle of social work in adjusting or repairing man's own handiwork, his social organization, we are overwhelmed with materials. War, for example, the selector between rival social structures, destroys more than it creates. The last five years of war have seen a greater holocaust of life and property than a whole century of natural calamities piled up. And it would have been even more destructive were it not for the Red Cross, the patriotic funds, the insurance, the munitions welfare work, and other mitigations of stark misery at home and abroad. Again, social work stands squarely against allowing Frankenstein to become the

victim of his monster, private property, when that property system invades the still more sacred rights of persons. Thus the social worker stands frequently as a shock absorber between capital and labor. Social case work, too, dealing with family problems, opens up the whole problem of the relationship between the family as an institution and human progress.

Such illustrations might be added indefinitely, but these few will suffice to establish the fact that social work as a progressive factor might be interpreted in terms of the great fundamental controls over social destiny. It stands as padding against the buffetings of the physical environment, it aids in keeping unobstructed the channels of human biology, and it modifies and promotes the institutional life of mankind. Hence it is a part of practical sociology or social technology, the art of community control over fate.

So far very well, you say; but how does that tell me whether my particular hobby, say, community surveying or birth control or health insurance, makes for social progress? Not every social-welfare scheme can be passed in review here, but certain objective tests can be laid down by reference to which any scheme may be judged. At least five fairly workable tests have been established in the attempt to give concrete meaning to the term social progress. We may for brevity call them the wealth, health, population, order, and opportunity tests. Let us take them one by one and see what they really mean.

In applying the wealth test we are not to be so naïve as to suppose, for example, that because the recorded per capita wealth of the United States leaped from \$308 in 1850 to \$1965 in 1912 the average inhabitant of this country was six times better off at the end of those sixty-two years. Much of this presumed "wealth" is merely heightened valuation of lands or securities. The actual land or its products in consumable goods did not increase sixfold. Nor did every individual's share increase

equally or even proportionately, as studies of ownership have disclosed. What the social worker must know before he can decide that his particular scheme is progressive in terms of real community wealth is whether productive skill and the will to produce are growing, whether the stock of houses and coal and potatoes and milk and good wearing cloth is actually expanding or whether only prices are going up; whether increasing wealth means increasing leisure or only overwork; whether the increased product really reaches people who are cold or hungry or ill-housed or thinly clad or whether it is wasted by faulty distribution or deliberately destroyed by the profiteers for the sake of maintaining scarcity prices; whether prosperity is really passed around in such a way that every normal person shall possess at least enough property to acquire the discipline and stability which come from ownership and the feeling of having some stake in the common life; whether the piled-up wealth is the mainspring of domestic broils and international wars or a source of peace and domestic tranquillity. The wealth test is not so simple as it sounds. By this analysis of its wider meanings must you judge your minimum-wage law, your income tax, your profit-sharing scheme, your factory-welfare work, your state or municipal ownership, and your coöperative commonwealth.

Or take the health test. A declining general or infantile death rate or an increasing life span has been called the verifiable test for a progressive community. But it is not to be taken as absolute or unique. Before becoming too complacent over saving the lives of a hundred thousand babies in one year—a noble and chivalrous purpose beyond doubt—one must be sure that he is not saving human trash and piling up social liabilities or that he is not encouraging heedless padding of the birth rate. And before concluding that to prolong the average length of life is an absolute good one must be sure that life is made worth living and that the extra lap added is not a sen-

tence to pain, slow starvation, misery, and friendlessness. It is not mere vegetative existence but the life more abundant which must add the convincing and determining seal of approval to all health work. Remember in your hospital social service or anti-tuberculosis work, your baby clinics and maternity hospitals and school inspections, that while death is a tragic waste, it is not the supreme tragedy. A life of futility, of unrequited and unilluminated toil, without hope, without a goal, without the exaltations that come from a sense of accomplishment and worth-whileness, this is the final touch of bitter irony, this is the real mortality which social work is called upon to combat and conquer.

These two tests converge upon the third, the population test. It is usually assumed that an increasing population is the mark of a progressive group, while a declining or stationary population implies social decadence or impairment of racial vitality. But this bald statement of the case needs much qualification. There is no indisputable mark of virtue or superiority in a high birth rate, for militarism or ruthless capitalism or lust or sentimentality or an ambitious church may manipulate the organs of social control to subject women to sexual slavery and to stimulate men to unbridled paternity. There has been altogether too much of Luther's fatalistic optimism urging to be fruitful and multiply for God would provide. Nor, on the other hand, is a low birth rate or a stationary population an inevitable mark of social degeneracy. Who since the Marne or Verdun dares to call France decadent? Or who lifts the voice in praise of German and Austrian superiority because of their birth rates? What we are after is not large populations, but good, sound, healthy, integrated, intelligent populations. We reckon not by how many babies are born, but by how many we rear and make into productive citizens. Net birth rate counts. Both positive and negative eugenics focus on this principle. Hence sound social work, like sound statesmanship,

is to be judged by what it does to promote a high average of health, vitality, and capacity in a population. This is the measuring stick which must inexorably be applied to all such proposals as birth control, sterilization or segregation of the unfit, encouragement of the fit to mate, endowment of motherhood, "absolute motherhood," and all such war-time devices to repair the ravages among male population as marriages by proxy, war brides, polygamy, and official illegitimacy. If the Great War brings us nearer a League of Nations, a League to Enforce Peace, or some other new international organization to keep the peace, this test of high average fitness stands a still greater chance of prevailing over the older rabbit-hutch policy of national strength. For the smaller nations are apparently coming into their own through some principle of federation which tends to nullify the law of the big battalions. The new law of population resembles the formula for the quantity of money, which states that the quantity of money is the total amount of all kinds of circulable media—metal currency, checks, and so forth, multiplied by the rapidity of circulation or turnover. Accordingly national strength is expressed by the total units of population *multiplied by their average mobility and capacity* ($NS = P \times AC$).

This is the clearest cue for the social worker, and it involves another; namely, that to secure the highest average capacity useful social variations must be favored and stimulated. In plain English this means working against dead-levelism or sheep-mindedness and encouraging a considerable dash of heresy, independence of thought, innovation, and initiative. In practice this necessitates freedom of discussion and daring to think over or discuss even the most untoward and ticklish subjects. I do not mean that the social worker is to promote anarchy or subsidize free love. I do not mean that social workers should be uncompromising radicals. They need neither smoke, gamble, drink cocktails, nor join the Sinn Fein to qualify

for their profession. But neither should they be afraid to tackle any proposal or practice on its merits however hoary with taboo it may be. Social work should lend its aid everywhere and always to any move which promises to develop the open mind; for the open mind, the flexible mind, the elastic mind is the first condition of progress, since progress is fundamentally growth from error into truth. This is the function of constructive discontent. No true social worker is complacent; he must be divinely discontented, for discontent with what was built this world and will rebuild it into the City of God.

But constructive discontent requires opportunity to function progressively. Balked or constricted or denied expression it festers and irritates or explodes into aimless violence. Hence the test of social opportunity as a test of progressive social work. By opportunity I mean the chance to be well born, to be decently cared for during childhood, to be decently educated, to play; a chance to develop one's productive skill; a chance of getting into the place where one's abilities, native and acquired, can express themselves to their highest; access to all the great heritage of culture that the ages have compounded and sent down to us; and the chance to participate in every normal social activity for which we are fitted. The world is sprinkled with morons, but, after all, the normal exceed the abnormal nearly ten to one; and an almost incredible store of talent lies latent and undeveloped in the great averages of mankind. The social worker's chief positive task through case work and mass work is to unlock this store of productive ability, to turn it into industry, thrift, creative art, and citizenship. The new democracy of which we dream will be progressive and indeed possible only as we are able to develop a skilled leadership consecrated to unselfish service, and a sufficient measure of income, leisure, and education to enable the average citizen to sense the common need, to feel the thrill of the common purpose, and to enlist for its realization. This

socializing of opportunity is the testing stone for all such projects as vocational training and guidance, limitation of child labor, continuation schools, vocational therapy, the universal franchise, the right to organize for collective bargaining, and many of the other "rights" which men have claimed and fought for in the last hundred years. It is likewise the core to the idea of democracy if that word has any solid content whatever. Moreover, it confers real meaning upon the struggle to control the conditions which menace life and health, for it adds the idea of quality to the otherwise empty gain of mere length of days. Finally, it is the only method by which contributive as contrasted with dependent types of social personality can be created or educated.

The last test, that of order and stability, involves many problems deeply imbedded in the theory and practice of social work. For crime, poverty, broken family life, migratory labor, and war all tear holes in the fabric of social order. Let no one be deceived into believing that these are necessary "costs of progress," even though sometimes they appear like the mud stirred through the social stream when its course is changed in a period of transition. Crime is an index of progress only in a somewhat paradoxical sense; that is, if the rate of serious crime diminishes while that of newer and pettier offenses rises, it may indicate that the social conscience is growing more sensitive and begins to recognize as crimes acts which heretofore have been tolerated. In this sense social work may contribute to progress, by searching out some of the more imponderable factors in criminal causation and in helping to brand as distinctly anti-social acts which we have been in the habit of considering as only unsocial or even as shrewd business practice. Laws against food adulteration, unfair prices, sweated or child-made goods, truck payment, and usury illustrate how social censure crystallizes itself into the criminal code.

Let me repeat that poverty is not a legitimate cost of progress. It is rather the index of social ineptitude and retardation. When we think of Europe as having made progress since the Black Death in spite of all handicaps of war or pestilence, it is not only because of the great era of invention, discovery, fine arts, and State building, but also because in these five centuries we have risen from a condition where nine-tenths of the people were at the poverty line to a level where scarcely more than one-tenth are so submerged. This insurance aspect of social life is one of the surest objective measures of material progress. But it is more than that, since poverty means the development of intelligence, of independence, and of the courage which is born of a sense of possible control over hostile forces. Involuntary poverty is the submerged mind. The significance of that fact appears when you remember that all human culture, all the finer things which make life worth while are the product of leisure activities. Enforced poverty inhibits creative activity and expresses itself only in dull resentment or passivity. The abolition of poverty, then, will not only remove a toxin which limits productivity but will release immense reservoirs of creative capacity in art and industry and citizenship. Make no apologies, then, to the theorists of social progress for any and every attempt to wipe out poverty. Every stroke against it cuts away another bit of the jungle which hinders our onward march. "Poverty," said Aristotle, "is the parent of revolution and crime." Every social measure reducing it becomes thus a new block in the great highway to social order, stability, and justice.

So long as men continue this side of heaven to dwell in families the stability of family life is of grave concern to social order. Whatever, therefore, social workers can do to promote sane matings or reduce domestic friction is so much to the good in terms of social progress. This does not mean merely reducing illegitimacy

or divorce. It means also releasing women from sexual dependence, it means controlled reproduction, it means adequate leisure and income for companionship and efficient parenthood, it means rational comradeship, it means some method by which obvious and unnecessary mistakes in mating may be prevented before they reach the altar or the divorce court. It means working out a new technique, perhaps, for forecasting the mental antagonisms and temperamental twists which result in sex neuroses, hysterias, and all the other pathologic problems which fall to the lot of the psycho-analyst. It means, finally, to make of the home not an absurd fetish, but a radiating center for the virtues of friendship and hospitality and for other intangible but no less socially valuable æsthetic products.

The bearing of this concept of the family upon such a phenomenon as the migratory worker is patent enough. For founding a home is an adventure in social order. The home builder and property owner is courted by Church and State and employer alike. A system of industry that depends upon or encourages the bird of passage is economically no less than morally wasteful. Just one illustration will prove this. Prostitution and venereal disease are economic wastes, whether you measure them in the short run or the long run, whether in terms of sickness, unemployment, irregular output, police costs, or depleted race vitality. And they will remain unsolved social problems so long as armies of casual workers roam about lacking the ballast of home ties themselves and disturbing the normal ratio of the sexes in the communities where they camp. Whatever, then, social workers can do to stabilize the mentally normal migratory worker and to make it possible for him through proper vocational training and decent income to settle down into the domestic harness may be set off as a progress asset. Civilized man with his marvelous means of transportation must beware of falling a victim to his own devices. In

his annihilation of space he must heed lest he annihilate many of those most precious, salutary responsibilities and ties which have made him ordered man out of the irresponsible and vagrant savage.

At first glance it would seem that social work as such could do nothing to reduce the anarchy of war. But closer analysis shows many openings for direct and indirect service. First of all I suppose the social worker serves the cause of human order and progress by being a real pacifist, by his insistence upon the substitution of mediation and rational persuasion for blind force in the settlement of group conflicts. Let there be no misunderstanding about what I mean by pacifism in general or with reference to the present war. There is a whole universe of difference between *pacifism* and *passivism*. I call myself a scientific pacifist and can only see in war more of wastage than of profit to humanity, but I want to see the conflict through which we have just passed fought through to a successful finish in the shape of stability, order, and wholesome discipline. I want peace, a durable peace, through the creation of new understandings and new solidarities between nations, after they have tried vainly by wholesale murder and anarchy to adjust their grievances.

The trouble with America during the first years of this war was not, however, the pacifism of a few social workers and religious leaders; much of that pacifism was genuine and serviceable, some of it was questionable posing, affectation, or downright cowardice. But the real trouble was passivism, sentimentality, international myopia, and an utterly unscientific sense of our remoteness from and unconcern with what was going on in the cockpit of Europe. We sat cultivating international *laissez faire*, and with a tragic lack of perspective believed that manifest destiny would bring us out on top of the human heap unscathed, even though rather inglorious. It took three years for us to wake up to the fact that we are all of one

blood, part and parcel of each other, and that the tragedy of Europe involved us inexorably.

I am afraid that it took us social workers also a long time to waken to the true situation and to reach the conclusion that true pacifism if it would combat militarism must fight now and fight with grimmest determination. Fortunate it is for ourselves and fortunate for this country if we have screwed up our minds to grasp the fact that war is not to be eliminated by supine subjection to the Hun, whatever his guise, but by applying the police idea to international affairs and by sublimating the war impulse. Organized policing has aided enormously in cutting down the toll of violent crimes in the last century. As I see it, America has determined that this same effective policing shall be introduced to control and checkmate nations which pillage and rob and murder wantonly, and to grapple with, intern, or even exterminate the implacable and the insane nations. In other words, just as the violent and bloody types of men have been weeded out through the selective process of law and criminal justice within groups, so also a similar system must be set up and operated for selecting to final extinction the lawless and willful nations of the earth.

Social workers can accomplish a great task of mediation and interpretation by spreading this police concept of America's war, peace and reconstruction mission. This is a form of constructive patriotism for which social workers are peculiarly fitted since they by the very nature of their profession must come into close contact with the humble, the ignorant, the foreign born, and the disinherited whose apathy or hostility to America's purposes has been so largely the result of our policy of neglect and insouciance. The creation of interracial understandings, the ministry of amalgamation, the easing up of social adaptations—all these are the peculiar function of our profession. In sociological parlance the social worker is an agent for social pollination, or cross-fertilization of

cultures. Need I illustrate by the labors of Jane Addams, Mary MacDowell, Robert Woods, Peter Roberts, Graham Taylor, or a score of others?

Moreover, in the most literal sense social work is real military preparedness. Only a sound, intelligent population can make a good fighting machine in these days of colossal conflict. Whatever prevents social deterioration aids in this protective work. Think, too, of the great tasks turned over to social workers in preparing our armies, in maintaining war morale—the work of the Red Cross, the Fosdick Commission, the War Camp Community Service, the Y. M. C. A., and other great organizations laboring as official or quasi-official adjuncts to the army and navy. The government's stupendous wartime social-welfare policy was at once the greatest opportunity professional social work ever had, and its greatest challenge.

It is from this standpoint that we are wholly justified in hazarding the belief that social work itself may turn out to be one of the "moral equivalents of war," a sublimation of the impulse to fight, a technique, and a field of battle. Is it beyond possibility that the vigorous business and professional men who enlisted in the various forms of noncombatant war service when disqualified for army or navy will yield to the fascination of fighting alcohol and vice and laziness and thriftlessness and extravagance and sickness and bad housing and industrial exploitation after the wars are over? Some, of course, will be glad to get back to money-making and whist and beer, glad to be done with committees and drives and solicitation. But many more will find it impossible to settle back into the old ways of letting things drift and of doing good vicariously. They will want to consolidate victory, to gather the fruits of peace in a democracy of service, and to make sure by their own contributions that this fearful struggle shall not have been in vain.

These, then, are some of the implications of social prog-

ress as they touch scientific social work. Remember, however, that humanity has been at least half a million years in the making, and that in consequence human reconstruction and social progress are slow. Science is purposive and ameliorative, but it is also patient. The late Vice President Fairbanks left a trust fund of \$50,000 the income of which is to be distributed to social-welfare agencies every fifty years for five hundred years. For five hundred years! Was this Indiana conservatism wielding the dead hand, or was it common sense? Five hundreds years! Not even the eugenists or the Bolsheviks could transform the world in five centuries. Cheap houses can be build overnight on the sand, but the gospels tell us of their speedy end. The road to the great house of many mansions which humanity is building for itself is long and winding; it has to be built over morasses of human depravity which must be drained; it must be blasted through mountain ranges of selfishness and prejudice; it must skirt giddy chasms full of the bones of the unwary. But it is building, and will continue building just so long as men lend their science and their love and their skill to the great commission. Is it not a glorious privilege that social workers are permitted to share increasingly in this supreme and thrilling enterprise of human engineering? That is the goal of the scientific spirit, and that also is its highest reward.
